目录

1 使用前必读	1
1.1 概述	1
1.2 调用说明	1
1.3 终端节点	1
1.4 约束与限制	1
1.5 基本概念	1
1.6 API 版本选择建议	2
2 如何调用 API	4
2.1 构造请求	4
2.2 认证鉴权	7
2.3 返回结果	9
3 快速入门	11
4 API	15
4.1 Metrics	15
4.1.1 获取指定 namespace 下所有 pods 的 metrics 信息	15
4.1.2 获取指定 namespace 下指定 pod 的 metrics 信息	32
4.2 EIPPool	45
4.2.1 查询指定 namespace 下的 EIP Pools	45
4.2.2 创建 EIPPool	62
4.2.3 删除指定的 EIPPool	104
4.2.4 查询指定的 EIPPool	117
4.2.5 更新 EIPPool	129
4.2.6 替换 EIPPool	142
4.2.7 查询指定的 EIPPool	177
4.3 Network	189
4.3.1 删除指定 namespace 下的 Networks	189
4.3.2 查询指定 namespace 下的 Networks	201
4.3.3 创建 Network	216
4.3.4 删除 Network	251
4.3.5 查询 Network	272
4.3.6 查询 Network 状态	281
5 Kubernetes API	292

5.1 ConfigMap.....	292
5.1.1 删除指定 namespace 下的 ConfigMaps.....	292
5.1.2 查询指定 namespace 下的 ConfigMaps.....	304
5.1.3 创建 ConfigMap.....	319
5.1.4 删除 ConfigMap.....	352
5.1.5 查询 ConfigMap.....	363
5.1.6 更新 ConfigMap.....	372
5.1.7 替换 ConfigMap.....	383
5.2 Pod.....	410
5.2.1 删除指定 namespace 下的 Pods.....	410
5.2.2 查询指定 namespace 下的 Pods.....	422
5.2.3 创建 Pod.....	502
5.2.4 删除 Pod.....	825
5.2.5 查询 Pod.....	973
5.2.6 更新 Pod.....	1048
5.2.7 替换 Pod.....	1124
5.2.8 进入容器执行命令.....	1368
5.2.9 进入容器执行命令.....	1370
5.2.10 查询 Pod 日志.....	1373
5.2.11 查询 Pod 状态.....	1376
5.2.12 查询用户所有的 Pods.....	1450
5.3 StorageClass.....	1529
5.3.1 查询/apis/storage.k8s.io/v1 版本的所有 storage class.....	1529
5.3.2 查询指定的 storage class.....	1544
5.4 Service.....	1553
5.4.1 查询指定 namespace 下的 Services.....	1553
5.4.2 创建 Service.....	1574
5.4.3 删除 Service.....	1635
5.4.4 查询 Service.....	1647
5.4.5 更新 Service.....	1662
5.4.6 替换 Service.....	1679
5.4.7 查询 service 状态.....	1727
5.5 Deployment.....	1742
5.5.1 查询用户所有 Deployments.....	1742
5.5.2 删除指定 namespace 下 Deployments.....	1821
5.5.3 查询指定 namespace 下的 Deployments.....	1833
5.5.4 创建 Deployment.....	1912
5.5.5 删除 Deployment.....	2227
5.5.6 查询 Deployment.....	2240
5.5.7 更新 Deployment.....	2313
5.5.8 替换 Deployment.....	2388
5.5.9 查询 Deployment 的伸缩操作.....	2629

5.5.10 更新 Deployment 的伸缩操作.....	2638
5.5.11 替换 Deployment 的伸缩操作.....	2649
5.5.12 查询 Deployment 状态.....	2675
5.6 Ingress.....	2748
5.6.1 删除指定 namespace 下的 ingresses.....	2748
5.6.2 查询指定 namespace 下的 Ingresses.....	2761
5.6.3 创建 Ingress.....	2780
5.6.4 删除 Ingress.....	2832
5.6.5 查询 Ingress.....	2844
5.6.6 更新 Ingress.....	2857
5.6.7 替换 Ingress.....	2874
5.6.8 查询 Ingress 状态.....	2915
5.7 OpenAPIv2.....	2928
5.7.1 查询 open api swagger 信息.....	2928
5.8 VolcanoJob.....	2930
5.8.1 删除指定 namespace 下的 Volcano Jobs.....	2930
5.8.2 查询指定 namespace 下的 Volcano Jobs.....	2941
5.8.3 创建 Volcano Job.....	2962
5.8.4 删除 Volcano Job.....	3023
5.8.5 查询 Volcano Job 详情.....	3035
5.8.6 更新 Volcano Job.....	3052
5.8.7 替换 Volcano Job.....	3070
5.9 Namespace.....	3118
5.9.1 查询所有 Namespaces.....	3118
5.9.2 创建 Namespace.....	3133
5.9.3 删除 Namespace.....	3168
5.9.4 查询 Namespace.....	3179
5.10 ClusterRole.....	3188
5.10.1 获取 ClusterRole 列表.....	3188
5.10.2 查询指定的 ClusterRole.....	3203
5.11 Secret.....	3214
5.11.1 删除指定 namespace 下的 Secrets.....	3214
5.11.2 查询指定 namespace 下的 Secrets.....	3227
5.11.3 创建 Secret.....	3240
5.11.4 删除 Secret.....	3274
5.11.5 查询 Secret.....	3286
5.11.6 更新 Secret.....	3295
5.11.7 替换 Secret.....	3306
5.12 Endpoint.....	3333
5.12.1 查询指定 namespace 下的 Endpoints.....	3333
5.12.2 创建 Endpoint.....	3348
5.12.3 删除 Endpoint.....	3390

5.12.4 查询 Endpoint.....	3402
5.12.5 更新 Endpoint.....	3414
5.12.6 替换 Endpoint.....	3427
5.13 ResourceQuota.....	3461
5.13.1 查询指定 namespace 下的 resourcequotas.....	3461
5.13.2 查询指定的 resourcequota.....	3476
5.14 CronJob.....	3487
5.14.1 查询所有 namespace 下的 CronJobs.....	3487
5.15 API groups.....	3565
5.15.1 查询 APIVersions.....	3565
5.15.2 查询所有 v1 版本的 API.....	3568
5.15.3 查询 APIGroupList.....	3572
5.15.4 查询 APIGroup /apis/apps.....	3577
5.15.5 查询所有 apps/v1 的 API.....	3581
5.15.6 查询 APIGroup /apis/batch.....	3585
5.15.7 查询 APIGroup /apis/batch.volcano.sh.....	3588
5.15.8 查询所有 batch.volcano.sh/v1alpha1 的 API.....	3591
5.15.9 查询所有 batch/v1 的 API.....	3594
5.15.10 查询所有 batch/v1beta1 的 API.....	3598
5.15.11 查询 APIGroup /apis/crd.yangtse.cni.....	3601
5.15.12 查询所有 crd.yangtse.cni/v1 的 API.....	3604
5.15.13 查询 APIGroup /apis/extensions.....	3608
5.15.14 查询所有 extensions/v1beta1 的 API.....	3611
5.15.15 查询 APIGroup /apis/metrics.k8s.io.....	3614
5.15.16 查询所有 metrics.k8s.io/v1beta1 的 API.....	3618
5.15.17 查询 APIGroup /apis/networking.cci.io.....	3621
5.15.18 查询所有 networking.cci.io/v1beta1 的 API.....	3625
5.15.19 查询 APIGroup /apis/rbac.authorization.k8s.io.....	3628
5.15.20 查询所有 rbac.authorization.k8s.io/v1 的 API.....	3632
5.16 Event.....	3635
5.16.1 查询指定 namespace 下的 Events.....	3635
5.16.2 删除 Event.....	3652
5.16.3 查询 Event.....	3664
5.17 PersistentVolumeClaim.....	3675
5.17.1 查询指定 namespace 下的 PersistentVolumeClaims.....	3675
5.17.2 创建 PersistentVolumeClaim.....	3692
5.17.3 删除 PersistentVolumeClaim.....	3740
5.17.4 查询 PersistentVolumeClaim.....	3766
5.17.5 替换 PersistentVolumeClaims.....	3779
5.18 RoleBinding.....	3817
5.18.1 获取指定 namespace 下 RoleBinding 列表.....	3817
5.18.2 创建 RoleBinding.....	3831

5.18.3 删除指定的 RoleBinding.....	3866
5.18.4 获取指定的 RoleBinding.....	3877
5.18.5 更新指定的 RoleBinding.....	3886
5.18.6 替换指定的 RoleBinding.....	3898
5.18.7 获取 RoleBinding 列表.....	3925
5.19 StatefulSet.....	3939
5.19.1 删除指定 namespace 下的 StatefulSets.....	3939
5.19.2 查询指定 namespace 下的 StatefulSets.....	3951
5.19.3 创建 StatefulSet.....	4031
5.19.4 删除 StatefulSet.....	4347
5.19.5 查询 StatefulSet.....	4359
5.19.6 更新 StatefulSet.....	4433
5.19.7 替换 StatefulSet.....	4509
5.19.8 查询 StatefulSet 状态.....	4754
5.19.9 查询用户所有的 StatefulSets.....	4828
5.20 Job.....	4908
5.20.1 查询用户所有的 Jobs.....	4908
5.20.2 删除指定 namespace 下的 Jobs.....	4986
5.20.3 查询指定 namespace 下的 Jobs.....	4998
5.20.4 创建 Job.....	5076
5.20.5 删除 Job.....	5389
5.20.6 查询 Job.....	5402
5.20.7 更新 Job.....	5475
5.20.8 替换 Job.....	5549
5.20.9 查询 Job 状态.....	5787
5.21 ReplicaSet.....	5859
5.21.1 查询指定 namespace 下的 ReplicaSets.....	5859
5.21.2 查询 ReplicaSet.....	5936

9.1.4.6 更新 PyTorchJob.....	6367
9.1.4.7 替换 PyTorchJob.....	6370
A 修订记录.....	6375

1 使用前必读

1.1 概述

欢迎使用云容器实例（Cloud Container Instance）。云容器实例提供 Serverless Container（无服务器容器）引擎，让您无需创建和管理服务器集群即可直接运行容器。

您可以使用本文档提供API对云容器实例进行相关操作，如创建、删除、变更规格等。

在调用云容器实例API之前，请确保已经充分了解云容器实例相关概念，并对 Kubernetes基本概念与知识有一定了解，详细信息请参见[产品介绍](#)。

1.2 调用说明

云容器实例提供了REST（Representational State Transfer）风格API，支持您通过HTTPS请求调用，调用方法请参见[如何调用API](#)。

1.3 终端节点

终端节点（Endpoint）即调用API的[请求地址](#)，不同服务不同区域的终端节点不同，您可以从[地区和终端节点](#)中查询所有服务的终端节点。

1.4 约束与限制

- 您能创建的云容器实例资源的数量与配额有关系，具体请参见[服务配额](#)。如果您需要扩大配额，请参见[如何申请扩大配额](#)。
- 更详细的限制请参见具体API的说明。

1.5 基本概念

- 账号

用户注册时的账号，账号对其所拥有的资源及云服务具有完全的访问权限，可以重置用户密码、分配用户权限等。由于账号是付费主体，为了确保账号安全，建议您不要直接使用账号进行日常管理工作，而是创建用户并使用用户进行日常管理工作。

- 用户

由账号在IAM中创建的用户，是云服务的使用人员，具有身份凭证（密码和访问密钥）。

通常在调用API的鉴权过程中，您需要用到账号、用户和密码等信息。

- 区域（Region）

从地理位置和网络时延维度划分，同一个Region内共享弹性计算、块存储、对象存储、VPC网络、弹性公网IP、镜像等公共服务。Region分为通用Region和专属Region，通用Region指面向公共租户提供通用云服务的Region；专属Region指只承载同一类业务或只面向特定租户提供业务服务的专用Region。

详情请参见[区域和可用区](#)。

- 可用区（AZ，Availability Zone）

一个可用区是一个或多个物理数据中心的集合，有独立的风火水电，AZ内逻辑上再将计算、网络、存储等资源划分成多个集群。一个Region中的多个AZ间通过高速光纤相连，以满足用户跨AZ构建高可用性系统的需求。

- 项目

区域默认对应一个项目，这个项目由系统预置，用来隔离物理区域间的资源（计算资源、存储资源和网络资源），以默认项目为单位进行授权，用户可以访问您账号中该区域的所有资源。如果您希望进行更加精细的权限控制，可以在区域默认的项目中创建子项目，并在子项目中创建资源，然后以子项目为单位进行授权，使得用户仅能访问特定子项目中的资源，使得资源的权限控制更加精确。

图 1-1 项目隔离模型

- 企业项目

企业项目是项目的升级版，针对企业不同项目间的资源进行分组和管理，是逻辑隔离。企业项目中可以包含多个区域的资源，且项目中的资源可以迁入迁出。

关于企业项目ID的获取及企业项目特性的详细信息，请参见《[企业管理用户指南](#)》。

1.6 API 版本选择建议

云容器实例提供了[Kubernetes API](#)，此版本跟随Kubernetes社区最新版本，且提供了老版本[Kubernetes API（OLD VERSIONS）](#)。

建议您使用Kubernetes API，能够更好的满足您的需求。

2 如何调用 API

2.1 构造请求

本节介绍REST API请求的组成，并以调用IAM服务的[管理员创建IAM用户](#)来说明如何调用API，该API获取用户的Token，Token可以用于调用其他API时鉴权。

请求 URI

请求URI由如下部分组成：

{URI-scheme}://{Endpoint}/{resource-path}?{query-string}

尽管请求URI包含在请求消息头中，但大多数语言或框架都要求您从请求消息中单独传递它，所以在此单独强调。

表 2-1 URI 中的参数说明

参数	描述
URI-scheme	表示用于传输请求的协议，当前所有API均采用HTTPS协议。
Endpoint	指定承载REST服务端点的服务器域名或IP，不同服务不同区域的Endpoint不同，您可以从 地区和终端节点 获取。 例如IAM服务在“中国-香港”区域的Endpoint为“iam.ap-southeast-1.myhuaweicloud.com”。
resource-path	资源路径，即API访问路径。从具体API的URI模块获取，例如“获取用户Token”API的resource-path为“/v3/auth/tokens”。
query-string	查询参数，是可选部分，并不是每个API都有查询参数。查询参数前面需要带一个“？”，形式为“参数名=参数取值”，例如“？limit=10”，表示查询不超过10条数据。

例如您需要获取IAM在“中国-香港”区域的Token，则需使用“中国-香港”区域的Endpoint（iam.ap-southeast-1.myhuaweicloud.com），并在[管理员创建IAM用户](#)的URI部分找到resource-path（/v3.0/OS-USER/users），拼接起来如下所示。

```
https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
```

图 2-1 URI 示意图

说明

为方便查看，在每个具体API的URI部分，只给出resource-path部分，并将请求方法写在一起。这是因为URI-scheme都是HTTPS，而Endpoint在同一个区域也相同，所以简洁起见将这两部分省略。

请求方法

HTTP请求方法（也称为操作或动词），它告诉服务您正在请求什么类型的操作。

表 2-2 HTTP 方法

方法	说明
GET	请求服务器返回指定资源。
PUT	请求服务器更新指定资源。
POST	请求服务器新增资源或执行特殊操作。
DELETE	请求服务器删除指定资源，如删除对象等。
HEAD	请求服务器资源头部。
PATCH	请求服务器更新资源的部分内容。 当资源不存在的时候，PATCH可能会去创建一个新的资源。

在[管理员创建IAM用户](#)的URI部分，您可以看到其请求方法为“POST”，则其请求为：

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
```

请求消息头

附加请求头字段，如指定的URI和HTTP方法所要求的字段。例如定义消息体类型的请求头“Content-Type”，请求鉴权信息等。

详细的公共请求消息头字段请参见[表2-3](#)。

表 2-3 公共请求消息头

名称	描述	是否必选	示例
Host	请求的服务器信息，从服务API的URL中获取。值为hostname[:port]。端口缺省时使用默认的端口，https的默认端口为443。	否 使用AK/SK认证时该字段必选。	code.test.com or code.test.com:443
Content-Type	消息体的类型（格式）。推荐用户使用默认值application/json，有其他取值时会在具体接口中专门说明。	是	application/json
Content-Length	请求body长度，单位为Byte。	否	3495
X-Project-Id	project id，项目编号。请参考 获取项目ID 章节获取项目编号。	否 如果是专属云场景采用AK/SK认证方式的接口请求，或者多project场景采用AK/SK认证的接口请求，则该字段必选。	e9993fc787d94b6c886cb aa340f9c0f4
X-Auth-Token	用户Token。 用户Token也就是调用 获取用户Token 接口的响应值，该接口是唯一不需要认证的接口。 请求响应成功后在响应消息头（Headers）中包含的“X-Subject-Token”的值即为Token值。	否 使用Token认证时该字段必选。	注：以下仅为Token示例片段。 MIIPAgYJKoZlhvcNAQcCo ...ggg1BBIIlNPXsidG9rZ

说明

API同时支持使用AK/SK认证，AK/SK认证使用SDK对请求进行签名，签名过程会自动往请求中添加Authorization（签名认证信息）和X-Sdk-Date（请求发送的时间）请求头。

AK/SK认证的详细说明请参见[认证鉴权](#)的“AK/SK认证”。

对于[管理员创建IAM用户](#)接口，使用AK/SK方式认证时，添加消息头后的请求如下所示。

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
Content-Type: application/json
X-Sdk-Date: 20240416T095341Z
Authorization: SDK-HMAC-SHA256 Access=*****, SignedHeaders=content-type;host;x-sdk-date,
Signature=*****
```

请求消息体（可选）

该部分可选。请求消息体通常以结构化格式（如JSON或XML）发出，与请求消息头中Content-Type对应，传递除请求消息头之外的内容。若请求消息体中的参数支持中文，则中文字符必须为UTF-8编码。

每个接口的请求消息体内容不同，也并不是每个接口都需要有请求消息体（或者说消息体为空），GET、DELETE操作类型的接口就不需要消息体，消息体具体内容需要根据具体接口而定。

对于[管理员创建IAM用户](#)接口，您可以从接口的请求部分看到所需的请求参数及参数说明，将消息体加入后的请求如下所示，其中加粗的字段需要根据实际值填写。

- **accountid**为IAM用户所属的账号ID。
- **username**为要创建的IAM用户名。
- **email**为IAM用户的邮箱。
- *********为IAM用户的登录密码。

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
Content-Type: application/json
X-Sdk-Date: 20240416T095341Z
Authorization: SDK-HMAC-SHA256 Access=*****, SignedHeaders=content-type;host;x-sdk-date,
Signature=*****

{
  "user": {
    "domain_id": "accountid",
    "name": "username",
    "password": "*****",
    "email": "email",
    "description": "IAM User Description"
  }
}
```

到这里为止这个请求需要的内容就具备齐全了，您可以使用[curl](#)、[Postman](#)或直接编写代码等方式发送请求调用API。对于获取用户Token接口，返回的响应消息头中的“X-Subject-Token”就是需要获取的用户Token。有了Token之后，您就可以使用Token认证调用其他API。

2.2 认证鉴权

调用接口有如下两种认证方式，您可以选择其中一种进行认证鉴权。

- AK/SK认证：通过AK（Access Key ID）/SK（Secret Access Key）加密调用请求。推荐使用AK/SK认证，其安全性比Token认证要高。

- Token认证：通过Token认证调用请求。

AK/SK 认证

📖 说明

AK/SK签名认证方式仅支持消息体大小在12MB以内，12MB以上的请求请使用Token认证。

AK/SK认证就是使用AK/SK对请求进行签名，在请求时将签名信息添加到消息头，从而通过身份认证。

- AK (Access Key ID)：访问密钥ID。与私有访问密钥关联的唯一标识符；访问密钥ID和私有访问密钥一起使用，对请求进行加密签名。
- SK (Secret Access Key)：私有访问密钥。与访问密钥ID结合使用，对请求进行加密签名，可标识发送方，并防止请求被修改。

使用AK/SK认证时，您可以基于签名算法使用AK/SK对请求进行签名，也可以使用专门的签名SDK对请求进行签名。详细的签名方法和SDK使用方法请参见[API签名指南](#)。

📖 说明

签名SDK只提供签名功能，与服务提供的SDK不同，使用时请注意。

Token 认证

📖 说明

Token的有效期为24小时，需要使用一个Token鉴权时，可以先缓存起来，避免频繁调用。

Token在计算机系统中代表令牌（临时）的意思，拥有Token就代表拥有某种权限。Token认证就是在调用API的时候将Token加到请求消息头中，从而通过身份认证，获得操作API的权限。Token可通过调用[获取用户Token](#)接口获取。

调用本服务API需要项目级别的Token，即调用[获取用户Token](#)接口时，请求body中auth.scope的取值需要选择project，如下所示。

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username", //IAM用户名
          "password": $ADMIN_PASS, //IAM用户密码，建议在配置文件或者环境变量中密文存放，使用时解密，确保安全
          "domain": {
            "name": "domainname" //IAM用户所属账号名
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "xxxxxxx" //项目名称
      }
    }
  }
}
```

获取Token后，再调用其他接口时，您需要在请求消息头中添加“X-Auth-Token”，其值即为Token。例如Token值为“ABCDEFJ...”，则调用接口时将“X-Auth-Token: ABCDEFJ...”加到请求消息头即可，如下所示。

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/projects
Content-Type: application/json
X-Auth-Token: ABCDEFJ....
```

2.3 返回结果

状态码

请求发送以后，您会收到响应，其中包含状态码、响应消息头和消息体。

状态码是一组从1xx到5xx的数字代码，状态码表示了请求响应的状态，完整的状态码列表请参见[状态码](#)。

对于[管理员创建IAM用户](#)接口，如果调用后返回状态码为“201”，则表示请求成功。

响应消息头

对应请求消息头，响应同样也有消息头，如“Content-type”。

对于[管理员创建IAM用户](#)接口，返回如[图2-2](#)所示的消息头，其中“X-Subject-Token”就是需要获取的用户Token。有了Token之后，您就可以使用Token认证调用其他API。

说明

建议在配置文件或者环境变量中密文存放，使用时解密，确保安全。

图 2-2 管理员创建 IAM 用户响应消息头

```
"X-Frame-Options": "SAMEORIGIN",
"X-IAM-ETag-id": "2562365939-d8f6f12921974cb097338ac11fceac8a",
"Transfer-Encoding": "chunked",
"Strict-Transport-Security": "max-age=31536000; includeSubdomains;",
"Server": "api-gateway",
"X-Request-Id": "af2953f2bcc67a42325a69a19e6c32a2",
"X-Content-Type-Options": "nosniff",
"Connection": "keep-alive",

"Content-Type": "application/json; charset=utf8"
```

响应消息体（可选）

该部分可选。响应消息体通常以结构化格式（如JSON或XML）返回，与响应消息头中Content-Type对应，传递除响应消息头之外的内容。

对于[管理员创建IAM用户](#)接口，返回如下消息体。为篇幅起见，这里只展示部分内容。

```
{
  "user": {
```

```
"id": "c131886aec...",
"name": "IAMUser",
"description": "IAM User Description",
"areacode": "",
"phone": "",
"email": "****@***.com",
"status": null,
"enabled": true,
"pwd_status": false,
"access_mode": "default",
"is_domain_owner": false,
"xuser_id": "",
"xuser_type": "",
"password_expires_at": null,
"create_time": "2024-05-21T09:03:41.000000",
"domain_id": "d78cbac1.....",
"xdomain_id": "30086000.....",
"xdomain_type": "",
"default_project_id": null
}
}
```

当接口调用出错时，会返回错误码及错误信息说明，错误响应的Body体格式如下所示。

```
{
  "error_msg": "The request message format is invalid.",
  "error_code": "IMG.0001"
}
```

其中，error_code表示错误码，error_msg表示错误描述信息。

3 快速入门

概述

本文通过调用一系列云容器实例的API使用nginx镜像创建一个工作负载，介绍使用云容器实例API的基本流程。

其中，镜像直接使用开源镜像中心的nginx镜像，容器的资源规格为0.25核CPU、512M内存，并绑定一个负载均衡实例，通过负载均衡实例从外网访问容器负载。

API的调用方法请参见[如何调用API](#)。

创建流程

1. 调用[创建Namespace](#)接口创建命名空间。
2. 调用[创建Network](#)接口创建网络，与VPC和子网关关联。
3. 调用[创建Deployment](#)接口创建nginx容器负载。

创建 Nginx 负载

步骤1 调用[创建Namespace](#)接口创建命名空间，并指定使用GPU型资源。

```
{
  "apiVersion": "v1",
  "kind": "Namespace",
  "metadata": {
    "name": "namespace-test",
    "annotations": {
      "namespace.kubernetes.io/flavor": "gpu-accelerated"
    }
  },
  "spec": {
    "finalizers": [
      "kubernetes"
    ]
  }
}
```

您需要指定如下参数。

- name: 命名空间的名称。
- namespace.kubernetes.io/flavor: 命名空间的类型，当前支持GPU加速型（**gpu-accelerated**）和通用计算型（**general-computing**）。GPU加速型命名空间中可以使用GPU显卡。

步骤2 调用**创建Network**接口创建网络，与VPC与子网关关联。

```
{
  "apiVersion": "networking.cci.io/v1beta1",
  "kind": "Network",
  "metadata": {
    "name": "test-network",
    "annotations": {
      "network.alpha.kubernetes.io/default-security-group": "security-group-id",
      "network.alpha.kubernetes.io/domain-id": "domain-id",
      "network.alpha.kubernetes.io/project-id": "project-id"
    }
  },
  "spec": {
    "cidr": "192.168.0.0/24",
    "attachedVPC": "vpc-id",
    "networkID": "network-id",
    "subnetID": "subnet-id",
    "networkType": "underlay_neutron"
  }
}
```

您需要指定如下参数。

- name：网络对象的名称。
- network.alpha.kubernetes.io/default-security-group：安全组ID，您可以在[安全组控制台](#)查看。
- network.alpha.kubernetes.io/domain-id：账号ID，获取方法请参见[获取账号ID](#)。
- network.alpha.kubernetes.io/project-id：项目ID，获取方法请参见[获取项目ID](#)。
- cidr：网段地址，虚拟私有云下可用子网的范围。
- attachedVPC：命名空间所在VPC（虚拟私有云）的ID，您可以在[虚拟私有云控制台](#)中查询，也可以通过[查询VPC列表](#)API查询。
- networkID：VPC内子网的网络ID，您可以在[虚拟私有云控制台](#)中查询，也可以通过[查询子网列表](#)API查询。
- subnetID：VPC内子网的ID，您可以在[虚拟私有云控制台](#)中查询，也可以通过[查询子网列表](#)API查询。

步骤3 调用**创建Deployment**接口创建nginx容器负载。

负载名称为nginx，使用开源镜像中心的nginx:latest镜像，容器的资源规格为0.25核CPU、1G内存。调用接口后，云容器实例会创建一个运行nginx的容器。

```
{
  "apiVersion": "apps/v1",
  "kind": "Deployment",
  "metadata": {
    "name": "nginx"
  },
  "spec": {
    "replicas": 1,
    "selector": {
      "matchLabels": {
        "app": "nginx"
      }
    }
  },
  "template": {
    "metadata": {
      "labels": {
        "app": "nginx"
      }
    }
  }
}
```

```
    },  
    "spec": {  
      "containers": [  
        {  
          "image": "nginx:latest",  
          "name": "container-0",  
          "resources": {  
            "limits": {  
              "cpu": "250m",  
              "memory": "1Gi"  
            },  
            "requests": {  
              "cpu": "250m",  
              "memory": "1Gi"  
            }  
          }  
        }  
      ],  
      "imagePullSecrets": [  
        {  
          "name": "imagepull-secret"  
        }  
      ]  
    }  
  }  
}
```

您需要指定如下参数。

- name: Deployment的名称。
- replicas: Pod的数量，即Deployment下有几个Pod。
- selector.matchLabels: Deployment使用哪些标签选择Pod，例如这里设置的标签app=nginx，当Pod有这个标签时，就会被Deployment选中管理。
- template: Pod的模板，定义Pod的各种配置和规格。
 - metadata.labels: Pod的标签。
 - spec.containers: Pod中容器的定义。
 - image: 创建容器使用的镜像。
 - resources.limits: 容器使用资源的大小限制，即容器使用的资源不能超过这个限制。
 - resources.requests: 容器申请使用资源的大小。

Nginx负载创建完后，您可以在云容器实例控制台查看到负载。

图 3-1 nginx

---结束

4 API

4.1 Metrics

4.1.1 获取指定 namespace 下所有 pods 的 metrics 信息

功能介绍

获取指定namespace下所有pods的metrics信息

调用方法

请参见[如何调用API](#)。

URI

GET /apis/metrics.k8s.io/v1beta1/namespaces/{namespace}/pods

表 4-1 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-2 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	否	String	If 'true', then the output is pretty printed.

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

请求参数

表 4-3 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 4-4 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
items	Array of io.k8s.metrics.pkg.apis.metrics.v1beta1.PodMetrics objects	List of pod metrics.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta_v2 object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds

表 4-5 io.k8s.metrics.pkg.apis.metrics.v1beta1.PodMetrics

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources

参数	参数类型	描述
containers	Array of io.k8s.metrics.pkg.apis.metrics.v1beta1.ContainerMetrics objects	Metrics for all containers are collected within the same time window.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta_v2 object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
timestamp	String	The following fields define time interval from which metrics were collected from the interval [Timestamp-Window, Timestamp].
window	String	Duration is a wrapper around time.Duration which supports correct marshaling to YAML and JSON. In particular, it marshals into strings, which can be used as map keys in json.

表 4-6 io.k8s.metrics.pkg.apis.metrics.v1beta1.ContainerMetrics

参数	参数类型	描述
name	String	Container name corresponding to the one from pod.spec.containers.
usage	Map<String,String>	The memory usage is the memory working set.

表 4-7 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta_v2

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</p>
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed.</p>

参数	参数类型	描述
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#idempotency</p>
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
initializers	io.k8s.apimachinery.pkg.apis.meta.v1.Initializers object	<p>An initializer is a controller which enforces some system invariant at object creation time. This field is a list of initializers that have not yet acted on this object. If nil or empty, this object has been completely initialized. Otherwise, the object is considered uninitialized and is hidden (in list/watch and get calls) from clients that haven't explicitly asked to observe uninitialized objects.</p> <p>When an object is created, the system will populate this list with the current set of initializers. Only privileged users may set or modify this list. Once it is empty, it may not be modified further by any user.</p> <p>DEPRECATED - initializers are an alpha field and will be removed in v1.15.</p>
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels

参数	参数类型	描述
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry_v2 objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object. This field is alpha and can be changed or removed without notice.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference_v2 objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-8 io.k8s.apimachinery.pkg.apis.meta.v1.Initializers

参数	参数类型	描述
pending	Array of io.k8s.apimachinery.pkg.apis.meta.v1.Initializer objects	Pending is a list of initializers that must execute in order before this object is visible. When the last pending initializer is removed, and no failing result is set, the initializers struct will be set to nil and the object is considered as initialized and visible to all clients.
result	io.k8s.apimachinery.pkg.apis.meta.v1.Status_v2 object	If result is set with the Failure field, the object will be persisted to storage and then deleted, ensuring that other clients can observe the deletion.

表 4-9 io.k8s.apimachinery.pkg.apis.meta.v1.Initializer

参数	参数类型	描述
name	String	name of the process that is responsible for initializing this object.

表 4-10 io.k8s.apimachinery.pkg.apis.meta.v1.Status_v2

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails_v2 object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta_v2 object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.

参数	参数类型	描述
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#spec-and-status

表 4-11 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails_v2

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-12 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 4-13 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry_v2

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fields	Object	Fields identifies a set of fields.
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-14 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference_v2

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-15 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta_v2

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only.

4.1.2 获取指定 namespace 下指定 pod 的 metrics 信息

功能介绍

获取指定namespace下指定pod的metrics信息

调用方法

请参见[如何调用API](#)。

URI

GET /apis/metrics.k8s.io/v1beta1/namespaces/{namespace}/pods/{name}

表 4-16 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the PodMetrics
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-17 Query 参数

参数	是否必选	参数类型	描述
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-18 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 4-19 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources

参数	参数类型	描述
containers	Array of io.k8s.metrics.pkg.apis.metrics.v1beta1.ContainerMetrics objects	Metrics for all containers are collected within the same time window.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta_v2 object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
timestamp	String	The following fields define time interval from which metrics were collected from the interval [Timestamp-Window, Timestamp].
window	String	Duration is a wrapper around time.Duration which supports correct marshaling to YAML and JSON. In particular, it marshals into strings, which can be used as map keys in json.

表 4-20 io.k8s.metrics.pkg.apis.metrics.v1beta1.ContainerMetrics

参数	参数类型	描述
name	String	Container name corresponding to the one from pod.spec.containers.
usage	Map<String,String>	The memory usage is the memory working set.

表 4-21 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta_v2

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</p>
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed.</p>

参数	参数类型	描述
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#idempotency</p>
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
initializers	io.k8s.apimachinery.pkg.apis.meta.v1.Initializers object	<p>An initializer is a controller which enforces some system invariant at object creation time. This field is a list of initializers that have not yet acted on this object. If nil or empty, this object has been completely initialized. Otherwise, the object is considered uninitialized and is hidden (in list/watch and get calls) from clients that haven't explicitly asked to observe uninitialized objects.</p> <p>When an object is created, the system will populate this list with the current set of initializers. Only privileged users may set or modify this list. Once it is empty, it may not be modified further by any user.</p> <p>DEPRECATED - initializers are an alpha field and will be removed in v1.15.</p>
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels

参数	参数类型	描述
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry_v2 objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object. This field is alpha and can be changed or removed without notice.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference_v2 objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-22 io.k8s.apimachinery.pkg.apis.meta.v1.Initializers

参数	参数类型	描述
pending	Array of io.k8s.apimachinery.pkg.apis.meta.v1.Initializer objects	Pending is a list of initializers that must execute in order before this object is visible. When the last pending initializer is removed, and no failing result is set, the initializers struct will be set to nil and the object is considered as initialized and visible to all clients.
result	io.k8s.apimachinery.pkg.apis.meta.v1.Status_v2 object	If result is set with the Failure field, the object will be persisted to storage and then deleted, ensuring that other clients can observe the deletion.

表 4-23 io.k8s.apimachinery.pkg.apis.meta.v1.Initializer

参数	参数类型	描述
name	String	name of the process that is responsible for initializing this object.

表 4-24 io.k8s.apimachinery.pkg.apis.meta.v1.Status_v2

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails_v2 object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta_v2 object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.

参数	参数类型	描述
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#spec-and-status

表 4-25 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails_v2

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-26 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 4-27 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta_v2

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#concurrency-control-and-consistency

参数	参数类型	描述
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only.

表 4-28 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry_v2

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fields	Object	Fields identifies a set of fields.
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-29 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference_v2

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds

参数	参数类型	描述
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

4.2 EIPPool

4.2.1 查询指定 namespace 下的 EIP Pools

功能介绍

查询指定 namespace 下所有 EIP Pool 的详细信息。

调用方法

请参见[如何调用 API](#)。

URI

GET /apis/crd.yangtse.cni/v1/namespaces/{namespace}/eippools

表 4-30 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-31 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-36 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-37 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-38 spec

参数	参数类型	描述
amount	Integer	Amount is the amount of eips need to be create. 最小值: 0 最大值: 500

参数	参数类型	描述
eipAttributes	cni.yangtse.crd.v1.EIPAttributes object	Attributes is the eip attributes which used to create eip.
eips	Array of strings	EIPs used to generate EIP resources.

表 4-39 cni.yangtse.crd.v1.EIPAttributes

参数	参数类型	描述
alias	String	Alias of PublicIP
bandwidth	cni.yangtse.crd.v1.EIPBandwidth object	Bandwidth create attributes
ipVersion	Integer	IP Version of PublicIP 枚举值： <ul style="list-style-type: none">• 4• 6
networkType	String	Network Type of PublicIP

表 4-40 cni.yangtse.crd.v1.EIPBandwidth

参数	参数类型	描述
chargeMode	String	Bandwidth Charge Mode 枚举值： <ul style="list-style-type: none">• bandwidth• traffic
id	String	Bandwidth id, only useful for WHOLE bandwidth share type
name	String	Bandwidth name, only useful for PER bandwidth share type 最小长度：1 最大长度：64
shareType	String	Bandwidth Share Type 枚举值： <ul style="list-style-type: none">• PER• WHOLE

参数	参数类型	描述
size	Integer	Bandwidth size 最小值: 0 最大值: 200000

表 4-41 status

参数	参数类型	描述
associates	Map<String, cni.yangtse.crd.v1.EIPAssociate >	eip associate infos.
eips	Array of eips objects	EIPs is a set of generated EIP resources.
usage	String	Usage is usage of eip in this pool, e.g. 2/10.

表 4-42 cni.yangtse.crd.v1.EIPAssociate

参数	参数类型	描述
attachment	attachment object	Attachment is the eip attachment info.
privateIP	privateIP object	PrivateIP is private ip information

表 4-43 attachment

参数	参数类型	描述
freeTimestamp	String	Timestamp of NeutronPort be to FixedPreBound or FixedUnBound phase
neutronPortName	String	NeutronPortName is NeutronPort name which associated.
neutronPortNamespace	String	NeutronPortNamespace is NeutronPort namespace which associated.
nodeName	String	nodeName is node name where the NeutronPort resides, must with phase Bound, PreBound or FixedBound.
podName	String	Pod name

参数	参数类型	描述
podNamespace	String	Pod Namespace

表 4-44 privateIP

参数	参数类型	描述
id	String	Port ID or EIP ID
ipv4	String	IPv4 is the IPv4 address for traffic from the eni.
ipv6	String	IPv6 is the IPv6 address for traffic from the eni.
mac	String	MAC is the MAC address of the endpoint interface.
status	String	Status of this IP

表 4-45 eips

参数	参数类型	描述
alias	String	Alias of the PublicIP
associateInstanceID	String	Associate instance id
associateInstanceType	String	Associate instance type
bandwidthChargeMode	String	Bandwidth charge mode of the PublicIP
bandwidthShareType	String	Bandwidth share type of the PublicIP
bandwidthSize	Integer	Bandwidth size of the PublicIP
id	String	The ID of the PublicIP
ipv4	String	The ipv4 address of the PublicIP
ipv6	String	The ipv6 address of the PublicIP
networkType	String	Network Type of PublicIP
status	String	PublicIP status

表 4-46 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

4.2.2 创建 EIPPool

功能介绍

创建EIPPool。

调用方法

请参见[如何调用API](#)。

URI

POST /apis/crd.yangtse.cni/v1/namespaces/{namespace}/eippools

表 4-47 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-48 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-49 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 4-50 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	spec object	Specification of the EIPPool.
status	否	status object	Status of the EIPPool.

表 4-51 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	是否必选	参数类型	描述
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述

表 4-62 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	spec object	Specification of the EIPPool.
status	status object	Status of the EIPPool.

表 4-63 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-64 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-65 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-66 spec

finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-88 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-89 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-90 spec

参数	参数类型	描述
amount	Integer	Amount is the amount of eips need to be create. 最小值: 0 最大值: 500

参数	参数类型	描述
eipAttributes	cni.yangtse.crd.v1.EIPAttributes object	Attributes is the eip attributes which used to create eip.
eips	Array of strings	EIPs used to generate EIP resources.

表 4-91 cni.yangtse.crd.v1.EIPAttributes

参数	参数类型	描述
alias	String	Alias of PublicIP
bandwidth	cni.yangtse.crd.v1.EIPBandwidth object	Bandwidth create attributes
ipVersion	Integer	IP Version of PublicIP 枚举值： <ul style="list-style-type: none">• 4• 6
networkType	String	Network Type of PublicIP

表 4-92 cni.yangtse.crd.v1.EIPBandwidth

参数	参数类型	描述
chargeMode	String	Bandwidth Charge Mode 枚举值： <ul style="list-style-type: none">• bandwidth• traffic
id	String	Bandwidth id, only useful for WHOLE bandwidth share type
name	String	Bandwidth name, only useful for PER bandwidth share type 最小长度：1 最大长度：64
shareType	String	Bandwidth Share Type 枚举值： <ul style="list-style-type: none">• PER• WHOLE

参数	参数类型	描述
size	Integer	Bandwidth size 最小值: 0 最大值: 200000

表 4-93 status

参数	参数类型	描述
associates	Map<String, cni.yangtse.crd.v1.EIPAssociate >	eip associate infos.
eips	Array of eips objects	EIPs is a set of generated EIP resources.
usage	String	Usage is usage of eip in this pool, e.g. 2/10.

表 4-94 cni.yangtse.crd.v1.EIPAssociate

参数	参数类型	描述
attachment	attachment object	Attachment is the eip attachment info.
privateIP	privateIP object	PrivateIP is private ip information

表 4-95 attachment

参数	参数类型	描述
freeTimestamp	String	Timestamp of NeutronPort be to FixedPreBound or FixedUnBound phase
neutronPortName	String	NeutronPortName is NeutronPort name which associated.
neutronPortNamespace	String	NeutronPortNamespace is NeutronPort namespace which associated.
nodeName	String	nodeName is node name where the NeutronPort resides, must with phase Bound, PreBound or FixedBound.
podName	String	Pod name

参数	参数类型	描述
podNamespace	String	Pod Namespace

表 4-96 privateIP

参数	参数类型	描述
id	String	Port ID or EIP ID
ipv4	String	IPv4 is the IPv4 address for traffic from the eni.
ipv6	String	IPv6 is the IPv6 address for traffic from the eni.
mac	String	MAC is the MAC address of the endpoint interface.
status	String	Status of this IP

表 4-97 eips

参数	参数类型	描述
alias	String	Alias of the PublicIP
associateInstanceId	String	Associate instance id
associateInstanceType	String	Associate instance type
bandwidthChargeMode	String	Bandwidth charge mode of the PublicIP
bandwidthShareType	String	Bandwidth share type of the PublicIP
bandwidthSize	Integer	Bandwidth size of the PublicIP
id	String	The ID of the PublicIP
ipv4	String	The ipv4 address of the PublicIP
ipv6	String	The ipv6 address of the PublicIP
networkType	String	Network Type of PublicIP
status	String	PublicIP status

请求示例

动态创建独占带宽类型的EIPPool，资源池中EIP数量为2。

```
{
  "apiVersion": "crd.yangtse.cni/v1",
  "kind": "EIPPool",
  "metadata": {
    "name": "eippool-test"
  },
  "spec": {
    "amount": 2,
    "eipAttributes": {
      "bandwidth": {
        "chargeMode": "bandwidth",
        "name": "eippool-test",
        "shareType": "PER",
        "size": 5
      },
      "ipVersion": 4,
      "networkType": "5_g-vm"
    }
  }
}
```

4.2.3 删除指定的 EIPPool

功能介绍

删除指定的EIPPool。

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/crd.yangtse.cni/v1/namespaces/{namespace}/eippools/{name}

表 4-98 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the EIPPool
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-99 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

参数	是否必选	参数类型	描述
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-100 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 4-101 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 4-102 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 4-103 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 4-104 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-105 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 4-106 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

4.2.4 查询指定的 EIPPool

功能介绍

查询指定的EIPPool的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/crd.yangtse.cni/v1/namespaces/{namespace}/eippools/{name}

表 4-111 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the EIPPool
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-112 Query 参数

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-113 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 4-114 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	spec object	Specification of the EIPPool.
status	status object	Status of the EIPPool.

表 4-115 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-116 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-117 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-118 spec

参数	参数类型	描述
amount	Integer	Amount is the amount of eips need to be create. 最小值: 0 最大值: 500

参数	参数类型	描述
eipAttributes	cni.yangtse.crd.v1.EIPAttributes object	Attributes is the eip attributes which used to create eip.
eips	Array of strings	EIPs used to generate EIP resources.

表 4-119 cni.yangtse.crd.v1.EIPAttributes

参数	参数类型	描述
alias	String	Alias of PublicIP
bandwidth	cni.yangtse.crd.v1.EIPBandwidth object	Bandwidth create attributes
ipVersion	Integer	IP Version of PublicIP 枚举值： <ul style="list-style-type: none">• 4• 6
networkType	String	Network Type of PublicIP

表 4-120 cni.yangtse.crd.v1.EIPBandwidth

参数	参数类型	描述
chargeMode	String	Bandwidth Charge Mode 枚举值： <ul style="list-style-type: none">• bandwidth• traffic
id	String	Bandwidth id, only useful for WHOLE bandwidth share type
name	String	Bandwidth name, only useful for PER bandwidth share type 最小长度：1 最大长度：64
shareType	String	Bandwidth Share Type 枚举值： <ul style="list-style-type: none">• PER• WHOLE

参数	参数类型	描述
size	Integer	Bandwidth size 最小值: 0 最大值: 200000

表 4-121 status

参数	参数类型	描述
associates	Map<String, cni.yangtse.crd.v1.EIPAssociate >	eip associate infos.
eips	Array of eips objects	EIPs is a set of generated EIP resources.
usage	String	Usage is usage of eip in this pool, e.g. 2/10.

表 4-122 cni.yangtse.crd.v1.EIPAssociate

参数	参数类型	描述
attachment	attachment object	Attachment is the eip attachment info.
privateIP	privateIP object	PrivateIP is private ip information

表 4-123 attachment

参数	参数类型	描述
freeTimestamp	String	Timestamp of NeutronPort be to FixedPreBound or FixedUnBound phase
neutronPortName	String	NeutronPortName is NeutronPort name which associated.
neutronPortNamespace	String	NeutronPortNamespace is NeutronPort namespace which associated.
nodeName	String	nodeName is node name where the NeutronPort resides, must with phase Bound, PreBound or FixedBound.
podName	String	Pod name

参数	参数类型	描述
podNamespace	String	Pod Namespace

表 4-124 privateIP

参数	参数类型	描述
id	String	Port ID or EIP ID
ipv4	String	IPv4 is the IPv4 address for traffic from the eni.
ipv6	String	IPv6 is the IPv6 address for traffic from the eni.
mac	String	MAC is the MAC address of the endpoint interface.
status	String	Status of this IP

表 4-125 eips

参数	参数类型	描述
alias	String	Alias of the PublicIP
associateInstanceId	String	Associate instance id
associateInstanceType	String	Associate instance type
bandwidthChargeMode	String	Bandwidth charge mode of the PublicIP
bandwidthShareType	String	Bandwidth share type of the PublicIP
bandwidthSize	Integer	Bandwidth size of the PublicIP
id	String	The ID of the PublicIP
ipv4	String	The ipv4 address of the PublicIP
ipv6	String	The ipv6 address of the PublicIP
networkType	String	Network Type of PublicIP
status	String	PublicIP status

4.2.5 更新 EIPPool

功能介绍

更新EIPPool。

调用方法

请参见[如何调用API](#)。

URI

PATCH /apis/crd.yangtse.cni/v1/namespaces/{namespace}/eippools/{name}

表 4-126 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the EIPPool
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-127 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-128 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	是否必选	参数类型	描述
Content-Type	是	String	<p>目前支持三种类型的PATCH请求方法的操作，参考《使用JSON合并patch更新Deployment》。</p> <ol style="list-style-type: none">1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

表 4-129 请求 Body 参数

参数	是否必选	参数类型	描述
-	是	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

响应参数

状态码： 200

表 4-130 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	spec object	Specification of the EIPPool.
status	status object	Status of the EIPPool.

表 4-131 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-132 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-133 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-134 spec

参数	参数类型	描述
amount	Integer	Amount is the amount of eips need to be create. 最小值: 0 最大值: 500

参数	参数类型	描述
eipAttributes	cni.yangtse.crd.v1.EIPAttributes object	Attributes is the eip attributes which used to create eip.
eips	Array of strings	EIPs used to generate EIP resources.

表 4-135 cni.yangtse.crd.v1.EIPAttributes

参数	参数类型	描述
alias	String	Alias of PublicIP
bandwidth	cni.yangtse.crd.v1.EIPBandwidth object	Bandwidth create attributes
ipVersion	Integer	IP Version of PublicIP 枚举值： <ul style="list-style-type: none">• 4• 6
networkType	String	Network Type of PublicIP

表 4-136 cni.yangtse.crd.v1.EIPBandwidth

参数	参数类型	描述
chargeMode	String	Bandwidth Charge Mode 枚举值： <ul style="list-style-type: none">• bandwidth• traffic
id	String	Bandwidth id, only useful for WHOLE bandwidth share type
name	String	Bandwidth name, only useful for PER bandwidth share type 最小长度：1 最大长度：64
shareType	String	Bandwidth Share Type 枚举值： <ul style="list-style-type: none">• PER• WHOLE

参数	参数类型	描述
size	Integer	Bandwidth size 最小值：0 最大值：200000

表 4-137 status

参数	参数类型	描述
associates	Map<String, cni.yangtse.crd.v1.EIPAssociate >	eip associate infos.
eips	Array of eips objects	EIPs is a set of generated EIP resources.
usage	String	Usage is usage of eip in this pool, e.g. 2/10.

表 4-138 cni.yangtse.crd.v1.EIPAssociate

参数	参数类型	描述
attachment	attachment object	Attachment is the eip attachment info.
privateIP	privateIP object	PrivateIP is private ip information

表 4-139 attachment

参数	参数类型	描述
freeTimestamp	String	Timestamp of NeutronPort be to FixedPreBound or FixedUnBound phase
neutronPortName	String	NeutronPortName is NeutronPort name which associated.
neutronPortNamespace	String	NeutronPortNamespace is NeutronPort namespace which associated.
nodeName	String	nodeName is node name where the NeutronPort resides, must with phase Bound, PreBound or FixedBound.
podName	String	Pod name

参数	参数类型	描述
podNamespace	String	Pod Namespace

表 4-140 privateIP

参数	参数类型	描述
id	String	Port ID or EIP ID
ipv4	String	IPv4 is the IPv4 address for traffic from the eni.
ipv6	String	IPv6 is the IPv6 address for traffic from the eni.
mac	String	MAC is the MAC address of the endpoint interface.
status	String	Status of this IP

表 4-141 eips

参数	参数类型	描述
alias	String	Alias of the PublicIP
associateInstanceId	String	Associate instance id
associateInstanceType	String	Associate instance type
bandwidthChargeMode	String	Bandwidth charge mode of the PublicIP
bandwidthShareType	String	Bandwidth share type of the PublicIP
bandwidthSize	Integer	Bandwidth size of the PublicIP
id	String	The ID of the PublicIP
ipv4	String	The ipv4 address of the PublicIP
ipv6	String	The ipv6 address of the PublicIP
networkType	String	Network Type of PublicIP
status	String	PublicIP status

请求示例

更新EIPPool中的labels值为"some-key":"some-value"。

```
{
  "metadata": {
    "labels": {
      "some-key": "some-value"
    }
  }
}
```

响应示例

状态码： 200

OK

4.2.6 替换 EIPPool

功能介绍

替换EIPPool。

调用方法

请参见[如何调用API](#)。

URI

PUT /apis/crd.yangtse.cni/v1/namespaces/{namespace}/eippools/{name}

表 4-142 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the EIPPool
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-143 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-144 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	是否必选	参数类型	描述
Content-Type	是	String	<p>目前支持三种类型的PATCH请求方法的操作，参考《使用JSON合并patch更新Deployment》。</p> <ol style="list-style-type: none"> 1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。 2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。 3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。
Content-Type	是	String	<p>消息体的类型（格式），默认取值为“application/json” 缺省值：application/json</p>

表 4-145 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	spec object	Specification of the EIPPool.
status	否	status object	Status of the EIPPool.

表 4-146 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	是否必选	参数类型	描述
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-147 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-148 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-149 spec

参数	是否必选	参数类型	描述
amount	否	Integer	Amount is the amount of eips need to be create. 最小值: 0 最大值: 500
eipAttributes	否	cni.yangtse.crd.v1.EIPAttributes object	Attributes is the eip attributes which used to create eip.
eips	否	Array of strings	EIPs used to generate EIP resources.

表 4-150 cni.yangtse.crd.v1.EIPAttributes

参数	是否必选	参数类型	描述
alias	否	String	Alias of PublicIP
bandwidth	是	cni.yangtse.crd.v1.EIPBandwidth object	Bandwidth create attributes
ipVersion	否	Integer	IP Version of PublicIP 枚举值： <ul style="list-style-type: none">• 4• 6
networkType	是	String	Network Type of PublicIP

表 4-151 cni.yangtse.crd.v1.EIPBandwidth

参数	是否必选	参数类型	描述
chargeMode	否	String	Bandwidth Charge Mode 枚举值： <ul style="list-style-type: none">• bandwidth• traffic
id	否	String	Bandwidth id, only useful for WHOLE bandwidth share type
name	否	String	Bandwidth name, only useful for PER bandwidth share type 最小长度：1 最大长度：64
shareType	否	String	Bandwidth Share Type 枚举值： <ul style="list-style-type: none">• PER• WHOLE
size	否	Integer	Bandwidth size 最小值：0 最大值：200000

表 4-152 status

参数	是否必选	参数类型	描述
associates	否	Map<String,c ni.yangtse.crd.v1.EIPAssociate>	eip associate infos.
eips	否	Array of eips objects	EIPs is a set of generated EIP resources.
usage	否	String	Usage is usage of eip in this pool, e.g. 2/10.

表 4-153 cni.yangtse.crd.v1.EIPAssociate

参数	是否必选	参数类型	描述
attachment	否	attachment object	Attachment is the eip attachment info.
privateIP	否	privateIP object	PrivateIP is private ip information

表 4-154 attachment

参数	是否必选	参数类型	描述
freeTimestamp	否	String	Timestamp of NeutronPort be to FixedPreBound or FixedUnBound phase
neutronPortName	否	String	NeutronPortName is NeutronPort name which associated.
neutronPortNamespace	否	String	NeutronPortNamespace is NeutronPort namespace which associated.
nodeName	否	String	nodeName is node name where the NeutronPort resides, must with phase Bound, PreBound or FixedBound.
podName	否	String	Pod name
podNamespace	否	String	Pod Namespace

表 4-155 privateIP

参数	是否必选	参数类型	描述
id	否	String	Port ID or EIP ID
ipv4	否	String	IPv4 is the IPv4 address for traffic from the eni.
ipv6	否	String	IPv6 is the IPv6 address for traffic from the eni.
mac	否	String	MAC is the MAC address of the endpoint interface.
status	否	String	Status of this IP

表 4-156 eips

参数	是否必选	参数类型	描述
alias	否	String	Alias of the PublicIP
associateInstanceID	否	String	Associate instance id
associateInstanceType	否	String	Associate instance type
bandwidthChargeMode	否	String	Bandwidth charge mode of the PublicIP
bandwidthShareType	否	String	Bandwidth share type of the PublicIP
bandwidthSize	否	Integer	Bandwidth size of the PublicIP
id	否	String	The ID of the PublicIP
ipv4	否	String	The ipv4 address of the PublicIP
ipv6	否	String	The ipv6 address of the PublicIP
networkType	否	String	Network Type of PublicIP
status	否	String	PublicIP status

manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-160 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-161 spec

参数	参数类型	描述
amount	Integer	Amount is the amount of eips need to be create. 最小值: 0 最大值: 500

参数	参数类型	描述
eipAttributes	cni.yangtse.crd.v1.EIPAttributes object	Attributes is the eip attributes which used to create eip.
eips	Array of strings	EIPs used to generate EIP resources.

表 4-162 cni.yangtse.crd.v1.EIPAttributes

参数	参数类型	描述
alias	String	Alias of PublicIP
bandwidth	cni.yangtse.crd.v1.EIPBandwidth object	Bandwidth create attributes
ipVersion	Integer	IP Version of PublicIP 枚举值： <ul style="list-style-type: none">• 4• 6
networkType	String	Network Type of PublicIP

表 4-163 cni.yangtse.crd.v1.EIPBandwidth

参数	参数类型	描述
chargeMode	String	Bandwidth Charge Mode 枚举值： <ul style="list-style-type: none">• bandwidth• traffic
id	String	Bandwidth id, only useful for WHOLE bandwidth share type
name	String	Bandwidth name, only useful for PER bandwidth share type 最小长度：1 最大长度：64
shareType	String	Bandwidth Share Type 枚举值： <ul style="list-style-type: none">• PER• WHOLE

参数	参数类型	描述
size	Integer	Bandwidth size 最小值：0 最大值：200000

表 4-164 status

参数	参数类型	描述
associates	Map<String, cni.yangtse.crd.v1.EIPAssociate >	eip associate infos.
eips	Array of eips objects	EIPs is a set of generated EIP resources.
usage	String	Usage is usage of eip in this pool, e.g. 2/10.

表 4-165 cni.yangtse.crd.v1.EIPAssociate

参数	参数类型	描述
attachment	attachment object	Attachment is the eip attachment info.
privateIP	privateIP object	PrivateIP is private ip information

表 4-166 attachment

参数	参数类型	描述
freeTimestamp	String	Timestamp of NeutronPort be to FixedPreBound or FixedUnBound phase
neutronPortName	String	NeutronPortName is NeutronPort name which associated.
neutronPortNamespace	String	NeutronPortNamespace is NeutronPort namespace which associated.
nodeName	String	nodeName is node name where the NeutronPort resides, must with phase Bound, PreBound or FixedBound.
podName	String	Pod name

参数	参数类型	描述
podNamespace	String	Pod Namespace

表 4-167 privateIP

参数	参数类型	描述
id	String	Port ID or EIP ID
ipv4	String	IPv4 is the IPv4 address for traffic from the eni.
ipv6	String	IPv6 is the IPv6 address for traffic from the eni.
mac	String	MAC is the MAC address of the endpoint interface.
status	String	Status of this IP

表 4-168 eips

参数	参数类型	描述
alias	String	Alias of the PublicIP
associateInstanceId	String	Associate instance id
associateInstanceType	String	Associate instance type
bandwidthChargeMode	String	Bandwidth charge mode of the PublicIP
bandwidthShareType	String	Bandwidth share type of the PublicIP
bandwidthSize	Integer	Bandwidth size of the PublicIP
id	String	The ID of the PublicIP
ipv4	String	The ipv4 address of the PublicIP
ipv6	String	The ipv6 address of the PublicIP
networkType	String	Network Type of PublicIP
status	String	PublicIP status

状态码： 201

表 4-169 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	spec object	Specification of the EIPPool.
status	status object	Status of the EIPPool.

表 4-170 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-171 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-172 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-173 spec

参数	参数类型	描述
amount	Integer	Amount is the amount of eips need to be create. 最小值: 0 最大值: 500

参数	参数类型	描述
eipAttributes	cni.yangtse.crd.v1.EIPAttributes object	Attributes is the eip attributes which used to create eip.
eips	Array of strings	EIPs used to generate EIP resources.

表 4-174 cni.yangtse.crd.v1.EIPAttributes

参数	参数类型	描述
alias	String	Alias of PublicIP
bandwidth	cni.yangtse.crd.v1.EIPBandwidth object	Bandwidth create attributes
ipVersion	Integer	IP Version of PublicIP 枚举值： <ul style="list-style-type: none">• 4• 6
networkType	String	Network Type of PublicIP

表 4-175 cni.yangtse.crd.v1.EIPBandwidth

参数	参数类型	描述
chargeMode	String	Bandwidth Charge Mode 枚举值： <ul style="list-style-type: none">• bandwidth• traffic
id	String	Bandwidth id, only useful for WHOLE bandwidth share type
name	String	Bandwidth name, only useful for PER bandwidth share type 最小长度：1 最大长度：64
shareType	String	Bandwidth Share Type 枚举值： <ul style="list-style-type: none">• PER• WHOLE

参数	参数类型	描述
size	Integer	Bandwidth size 最小值: 0 最大值: 200000

表 4-176 status

参数	参数类型	描述
associates	Map<String, cni.yangtse.crd.v1.EIPAssociate >	eip associate infos.
eips	Array of eips objects	EIPs is a set of generated EIP resources.
usage	String	Usage is usage of eip in this pool, e.g. 2/10.

表 4-177 cni.yangtse.crd.v1.EIPAssociate

参数	参数类型	描述
attachment	attachment object	Attachment is the eip attachment info.
privateIP	privateIP object	PrivateIP is private ip information

表 4-178 attachment

参数	参数类型	描述
freeTimestamp	String	Timestamp of NeutronPort be to FixedPreBound or FixedUnBound phase
neutronPortName	String	NeutronPortName is NeutronPort name which associated.
neutronPortNamespace	String	NeutronPortNamespace is NeutronPort namespace which associated.
nodeName	String	nodeName is node name where the NeutronPort resides, must with phase Bound, PreBound or FixedBound.
podName	String	Pod name

参数	参数类型	描述
podNamespace	String	Pod Namespace

表 4-179 privateIP

参数	参数类型	描述
id	String	Port ID or EIP ID
ipv4	String	IPv4 is the IPv4 address for traffic from the eni.
ipv6	String	IPv6 is the IPv6 address for traffic from the eni.
mac	String	MAC is the MAC address of the endpoint interface.
status	String	Status of this IP

表 4-180 eips

参数	参数类型	描述
alias	String	Alias of the PublicIP
associateInstanceId	String	Associate instance id
associateInstanceType	String	Associate instance type
bandwidthChargeMode	String	Bandwidth charge mode of the PublicIP
bandwidthShareType	String	Bandwidth share type of the PublicIP
bandwidthSize	Integer	Bandwidth size of the PublicIP
id	String	The ID of the PublicIP
ipv4	String	The ipv4 address of the PublicIP
ipv6	String	The ipv6 address of the PublicIP
networkType	String	Network Type of PublicIP
status	String	PublicIP status

请求示例

将已创建EIPPool中的label值替换为"some-key" : "some-value"。

4.2.7 查询指定的 EIPPool

功能介绍

查询指定的EIPPool的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/crd.yangtse.cni/v1/namespaces/{namespace}/eippools/{name}/status

表 4-181 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the EIPPool
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-182 Query 参数

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-183 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 4-184 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	spec object	Specification of the EIPPool.
status	status object	Status of the EIPPool.

表 4-185 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-186 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-187 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-188 spec

参数	参数类型	描述
amount	Integer	Amount is the amount of eips need to be create. 最小值: 0 最大值: 500

参数	参数类型	描述
eipAttributes	cni.yangtse.crd.v1.EIPAttributes object	Attributes is the eip attributes which used to create eip.
eips	Array of strings	EIPs used to generate EIP resources.

表 4-189 cni.yangtse.crd.v1.EIPAttributes

参数	参数类型	描述
alias	String	Alias of PublicIP
bandwidth	cni.yangtse.crd.v1.EIPBandwidth object	Bandwidth create attributes
ipVersion	Integer	IP Version of PublicIP 枚举值： <ul style="list-style-type: none">• 4• 6
networkType	String	Network Type of PublicIP

表 4-190 cni.yangtse.crd.v1.EIPBandwidth

参数	参数类型	描述
chargeMode	String	Bandwidth Charge Mode 枚举值： <ul style="list-style-type: none">• bandwidth• traffic
id	String	Bandwidth id, only useful for WHOLE bandwidth share type
name	String	Bandwidth name, only useful for PER bandwidth share type 最小长度：1 最大长度：64
shareType	String	Bandwidth Share Type 枚举值： <ul style="list-style-type: none">• PER• WHOLE

参数	参数类型	描述
size	Integer	Bandwidth size 最小值：0 最大值：200000

表 4-191 status

参数	参数类型	描述
associates	Map<String, cni.yangtse.crd.v1.EIPAssociate >	eip associate infos.
eips	Array of eips objects	EIPs is a set of generated EIP resources.
usage	String	Usage is usage of eip in this pool, e.g. 2/10.

表 4-192 cni.yangtse.crd.v1.EIPAssociate

参数	参数类型	描述
attachment	attachment object	Attachment is the eip attachment info.
privateIP	privateIP object	PrivateIP is private ip information

表 4-193 attachment

参数	参数类型	描述
freeTimestamp	String	Timestamp of NeutronPort be to FixedPreBound or FixedUnBound phase
neutronPortName	String	NeutronPortName is NeutronPort name which associated.
neutronPortNamespace	String	NeutronPortNamespace is NeutronPort namespace which associated.
nodeName	String	nodeName is node name where the NeutronPort resides, must with phase Bound, PreBound or FixedBound.
podName	String	Pod name

参数	参数类型	描述
podNamespace	String	Pod Namespace

表 4-194 privateIP

参数	参数类型	描述
id	String	Port ID or EIP ID
ipv4	String	IPv4 is the IPv4 address for traffic from the eni.
ipv6	String	IPv6 is the IPv6 address for traffic from the eni.
mac	String	MAC is the MAC address of the endpoint interface.
status	String	Status of this IP

表 4-195 eips

参数	参数类型	描述
alias	String	Alias of the PublicIP
associateInstanceId	String	Associate instance id
associateInstanceType	String	Associate instance type
bandwidthChargeMode	String	Bandwidth charge mode of the PublicIP
bandwidthShareType	String	Bandwidth share type of the PublicIP
bandwidthSize	Integer	Bandwidth size of the PublicIP
id	String	The ID of the PublicIP
ipv4	String	The ipv4 address of the PublicIP
ipv6	String	The ipv6 address of the PublicIP
networkType	String	Network Type of PublicIP
status	String	PublicIP status

4.3 Network

4.3.1 删除指定 namespace 下的 Networks

功能介绍

删除指定namespace下的所有Network对象。

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/networking.cci.io/v1beta1/namespaces/{namespace}/networks

表 4-196 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-197 Query 参数

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

参数	是否必选	参数类型	描述
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-198 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 4-199 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 4-200 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 4-201 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 4-202 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-203 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 4-204 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

4.3.2 查询指定 namespace 下的 Networks

功能介绍

查询指定namespace下的所有Network对象。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/networking.cci.io/v1beta1/namespaces/{namespace}/networks

表 4-205 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-206 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. 参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	io.k8s.api.cci.v1beta1.NetworkSpec object	Spec defines the attributes on a network
status	io.k8s.api.cci.v1beta1.NetworkStatus object	Status describes the network status

表 4-210 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 4-211 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-212 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-213 io.k8s.api.cci.v1beta1.NetworkSpec

参数	参数类型	描述
attachedVPC	String	ID of the VPC to attach
availableZone	String	available zone
cidr	String	The CIDR of the network

参数	参数类型	描述
networkID	String	network ID
networkType	String	network type like 'overlay_l2'
subnetID	String	Subnet ID
subnets	Array of io.k8s.api.cci.v1beta1.NetworkSubnet objects	Subnets

表 4-214 io.k8s.api.cci.v1beta1.NetworkSubnet

参数	参数类型	描述
cidr	String	The CIDR of the network
networkID	String	NetworkID describes the subnet network id
subnetID	String	SubnetID describes the subnet id

表 4-215 io.k8s.api.cci.v1beta1.NetworkStatus

参数	参数类型	描述
message	String	Message describes why network is in current state
state	String	State describes the network state

表 4-216 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

4.3.3 创建 Network

功能介绍

创建一个Network对象。

Network对象是华为云CCI新增对象，用于定义kubernetes中一个namespace内的网络。目前CCI支持VPC网络，一个VPC网络类型的network对象对应于华为云虚拟私有云服务中的一个子网。

CCI的容器网络依赖于华为云底层VPC网络，因此在创建network对象前，需要先调用虚拟私有云的接口创建或者查询已有子网信息。

📖 说明

须知：此处VPC和子网的网段不能为10.247.0.0/16，10.247.0.0/16是云容器实例预留给Service的网段。如果您使用此网段，后续可能会造成IP冲突，导致负载无法创建或服务不可用；如果您不需要通过Service访问，而是直接访问Pod，则可以使用此网段。

具体如何创建一个Network对象，可以参考[Namespace和Network](#)

调用方法

请参见[如何调用API](#)。

URI

POST /apis/networking.cci.io/v1beta1/namespaces/{namespace}/networks

表 4-217 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-218 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-219 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 4-220 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	否	io.k8s.api.cci.v1beta1.NetworkSpec object	Spec defines the attributes on a network
status	否	io.k8s.api.cci.v1beta1.NetworkStatus object	Status describes the network status

表 4-221 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-222 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-223 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-224 io.k8s.api.cci.v1beta1.NetworkSpec

参数	是否必选	参数类型	描述
attachedVPC	否	String	ID of the VPC to attach
availableZone	否	String	available zone
cidr	否	String	The CIDR of the network
networkID	否	String	network ID
networkType	否	String	network type like 'overlay_l2'
subnetID	否	String	Subnet ID

参数	是否必选	参数类型	描述
subnets	否	Array of io.k8s.api.cci.v1beta1.NetworkSubnet objects	Subnets

表 4-225 io.k8s.api.cci.v1beta1.NetworkSubnet

参数	是否必选	参数类型	描述
cidr	否	String	The CIDR of the network
networkID	否	String	NetworkID describes the subnet network id
subnetID	否	String	SubnetID describes the subnet id

表 4-226 io.k8s.api.cci.v1beta1.NetworkStatus

参数	是否必选	参数类型	描述
message	否	String	Message describes why network is in current state
state	否	String	State describes the network state

响应参数

deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 4-229 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-230 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-231 io.k8s.api.cci.v1beta1.NetworkSpec

参数	参数类型	描述
attachedVPC	String	ID of the VPC to attach
availableZone	String	available zone
cidr	String	The CIDR of the network

参数	参数类型	描述
networkID	String	network ID
networkType	String	network type like 'overlay_l2'
subnetID	String	Subnet ID
subnets	Array of io.k8s.api.cci.v1beta1.NetworkSubnet objects	Subnets

表 4-232 io.k8s.api.cci.v1beta1.NetworkSubnet

参数	参数类型	描述
cidr	String	The CIDR of the network
networkID	String	NetworkID describes the subnet network id
subnetID	String	SubnetID describes the subnet id

表 4-233 io.k8s.api.cci.v1beta1.NetworkStatus

参数	参数类型	描述
message	String	Message describes why network is in current state
state	String	State describes the network state

状态码： 201

表 4-234 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	io.k8s.api.cci.v1beta1.NetworkSpec object	Spec defines the attributes on a network
status	io.k8s.api.cci.v1beta1.NetworkStatus object	Status describes the network status

表 4-235 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. metadata.annotations必选字段数据结构说明

参数	是否必选	参数类型	描述
network.alpha.kubernetes.io/default-security-group	Yes	String	Network对应子网所属安全组ID。
network.alpha.kubernetes.io/project-id	Yes	String	Network所属用户的project-id, 获取方法请参见 获取项目ID 。

参数	是否必选	参数类型	描述
network.alpha.kubernetes.io/domain-id	Yes	String	Network所属用户的domain-id，获取方法请参见获取账号ID。

VPC网络类型

参数	是否必选	参数类型	描述
cidr	No	String	Network对应VPC子网的网段。 **说明：** 此处VPC和子网的网段不能为10.247.0.0/16，10.247.0.0/16是云容器实例预留给Service的网段。如果您使用此网段，后续可能会造成IP冲突，导致负载无法创建或服务不可用；如果您不需要通过Service访问，而是直接访问Pod，则可以使用此网段。
attachedVPC	Yes	String	Network所在VPC的ID。
networkType	Yes	String	Network网络类型，VPC网络类型取值： underlay_neutron 。
networkID	Yes	String	Network对应VPC子网的网络ID。
subnetID	Yes	String	Network对应VPC子网的子网ID。

参数	是否必选	参数类型	描述
availableZone	Yes	String	Network对应VPC子网所在可用区。当前支持“华北-北京四”、“华东-上海一”、“华东-上海二”和“华南-广州”区域，该值可设置为、“cn-north-4a”、“cn-east-3a”、“cn-east-2d”或“cn-south-1f”。

4.3.4 删除 Network

功能介绍

删除一个指定Network对象。

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/networking.cci.io/v1beta1/namespaces/{namespace}/networks/{name}

表 4-248 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Network
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-249 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

参数	是否必选	参数类型	描述
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-250 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 4-251 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 4-252 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 4-253 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	io.k8s.api.cci.v1beta1.NetworkSpec object	Spec defines the attributes on a network
status	io.k8s.api.cci.v1beta1.NetworkStatus object	Status describes the network status

表 4-254 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 4-255 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-256 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-257 io.k8s.api.cci.v1beta1.NetworkSpec

参数	参数类型	描述
attachedVPC	String	ID of the VPC to attach
availableZone	String	available zone
cidr	String	The CIDR of the network

参数	参数类型	描述
networkID	String	network ID
networkType	String	network type like 'overlay_l2'
subnetID	String	Subnet ID
subnets	Array of io.k8s.api.cci.v1beta1.NetworkSubnet objects	Subnets

表 4-258 io.k8s.api.cci.v1beta1.NetworkSubnet

参数	参数类型	描述
cidr	String	The CIDR of the network
networkID	String	NetworkID describes the subnet network id
subnetID	String	SubnetID describes the subnet id

表 4-259 io.k8s.api.cci.v1beta1.NetworkStatus

参数	参数类型	描述
message	String	Message describes why network is in current state
state	String	State describes the network state

状态码： 202

4.3.5 查询 Network

功能介绍

查询指定Network对象。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/networking.cci.io/v1beta1/namespaces/{namespace}/networks/{name}

表 4-267 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Network
namespace	是	String	object name and auth scope, such as for teams and projects

表 4-268 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 4-269 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 4-270 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	io.k8s.api.cci.v1beta1.NetworkSpec object	Spec defines the attributes on a network
status	io.k8s.api.cci.v1beta1.NetworkStatus object	Status describes the network status

表 4-271 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-272 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 4-273 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 4-274 io.k8s.api.cci.v1beta1.NetworkSpec

参数	参数类型	描述
attachedVPC	String	ID of the VPC to attach
availableZone	String	available zone
cidr	String	The CIDR of the network

参数	参数类型	描述
networkID	String	network ID
networkType	String	network type like 'overlay_l2'
subnetID	String	Subnet ID
subnets	Array of io.k8s.api.cci.v1beta1.NetworkSubnet objects	Subnets

表 4-275 io.k8s.api.cci.v1beta1.NetworkSubnet

参数	参数类型	描述
cidr	String	The CIDR of the network
networkID	String	NetworkID describes the subnet network id
subnetID	String	SubnetID describes the subnet id

表 4-276 io.k8s.api.cci.v1beta1.NetworkStatus

参数	参数类型	描述
message	String	Message describes why network is in current state
state	String	State describes the network state

5 Kubernetes API

5.1 ConfigMap

5.1.1 删除指定 namespace 下的 ConfigMaps

功能介绍

删除Namespace下所有ConfigMap。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/configmaps

表 5-1 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-2 Query 参数

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

参数	是否必选	参数类型	描述
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-5 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-6 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-7 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-8 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-9 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.1.2 查询指定 namespace 下的 ConfigMaps

功能介绍

查询Namespace下所有ConfigMap的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/configmaps

表 5-10 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-11 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-12 请求 Header 参数

参数	是否必选	参数类型	描述

表 5-13 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.core.v1.ConfigMap objects	Items is the list of ConfigMaps.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-14 io.k8s.api.core.v1.ConfigMap

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
binaryData	Map<String,String>	BinaryData contains the binary data. Each key must consist of alphanumeric characters, '-', '_' or '!'. BinaryData can contain byte sequences that are not in the UTF-8 range. The keys stored in BinaryData must not overlap with the ones in the Data field, this is enforced during validation process. Using this field will require 1.10+ apiserver and kubelet.
data	Map<String,String>	Data contains the configuration data. Each key must consist of alphanumeric characters, '-', '_' or '!'. Values with non-UTF-8 byte sequences must use the BinaryData field. The keys stored in Data must not overlap with the keys in the BinaryData field, this is enforced during validation process.
immutable	Boolean	Immutable, if set to true, ensures that data stored in the ConfigMap cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-15 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-16 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-17 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-18 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.1.3 创建 ConfigMap

功能介绍

创建ConfigMap。

调用方法

请参见[如何调用API](#)。

URI

POST /api/v1/namespaces/{namespace}/configmaps

表 5-19 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-20 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .

参数	是否必选	参数类型	描述
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-21 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-22 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
binaryData	否	Map<String,String>	BinaryData contains the binary data. Each key must consist of alphanumeric characters, '-', '_' or '!'. BinaryData can contain byte sequences that are not in the UTF-8 range. The keys stored in BinaryData must not overlap with the ones in the Data field, this is enforced during validation process. Using this field will require 1.10+ apiserver and kubelet.

参数	是否必选	参数类型	描述
data	否	Map<String,String>	Data contains the configuration data. Each key must consist of alphanumeric characters, '-', '_' or '!'. Values with non-UTF-8 byte sequences must use the BinaryData field. The keys stored in Data must not overlap with the keys in the BinaryData field, this is enforced during validation process.
immutable	否	Boolean	Immutable, if set to true, ensures that data stored in the ConfigMap cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-23 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-24 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-25 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.

kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-31 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-32 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-33 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

状态码： 202

表 5-34 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
binaryData	Map<String,String>	BinaryData contains the binary data. Each key must consist of alphanumeric characters, '-', '_' or '.'. BinaryData can contain byte sequences that are not in the UTF-8 range. The keys stored in BinaryData must not overlap with the ones in the Data field, this is enforced during validation process. Using this field will require 1.10+ apiserver and kubelet.
data	Map<String,String>	Data contains the configuration data. Each key must consist of alphanumeric characters, '-', '_' or '.'. Values with non-UTF-8 byte sequences must use the BinaryData field. The keys stored in Data must not overlap with the keys in the BinaryData field, this is enforced during validation process.
immutable	Boolean	Immutable, if set to true, ensures that data stored in the ConfigMap cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

请求示例

创建一个名称为“configmap-test”的configmap，配置数据键值。

```
{
  "apiVersion": "v1",
  "data": {
    "property_1": "test"
  },
  "kind": "ConfigMap",
  "metadata": {
    "name": "configmap-test"
  }
}
```

```
}  
}
```

响应示例

状态码: 200

OK

```
{  
  "apiVersion": "v1",  
  "data": {  
    "property_1": "test"  
  },  
  "kind": "ConfigMap",  
  "metadata": {  
    "creationTimestamp": "2018-09-04T03:11:29Z",  
    "name": "configmap-test",  
    "namespace": "namespace-test",  
    "resourceVersion": "5170290",  
    "selfLink": "/api/v1/namespaces/namespace-test/configmaps/configmap-test",  
    "uid": "379519a3-aff0-11e8-8f17-c81fbe371a17"  
  }  
}
```

5.1.4 删除 ConfigMap

功能介绍

删除ConfigMap。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/configmaps/{name}

表 5-38 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the ConfigMap
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-39 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-40 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-41 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-42 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-43 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-44 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-45 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-46 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

状态码： 202

表 5-47 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-48 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> for those errors this field may indicate how long to wait before taking the alternate action.

参数	参数类型	描述
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-49 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-50 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.1.5 查询 ConfigMap

功能介绍

查询ConfigMap详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/configmaps/{name}

表 5-51 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the ConfigMap
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-52 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-53 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-54 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
binaryData	Map<String,String>	BinaryData contains the binary data. Each key must consist of alphanumeric characters, '-', '_' or '.'. BinaryData can contain byte sequences that are not in the UTF-8 range. The keys stored in BinaryData must not overlap with the ones in the Data field, this is enforced during validation process. Using this field will require 1.10+ apiserver and kubelet.
data	Map<String,String>	Data contains the configuration data. Each key must consist of alphanumeric characters, '-', '_' or '.'. Values with non-UTF-8 byte sequences must use the BinaryData field. The keys stored in Data must not overlap with the keys in the BinaryData field, this is enforced during validation process.
immutable	Boolean	Immutable, if set to true, ensures that data stored in the ConfigMap cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-55 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-56 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-57 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

5.1.6 更新 ConfigMap

功能介绍

更新ConfigMap。

The following fields can be updated:

- metadata.labels
- metadata.annotations
- data

调用方法

请参见[如何调用API](#)。

URI

PATCH /api/v1/namespaces/{namespace}/configmaps/{name}

表 5-58 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the ConfigMap
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-59 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).

参数	是否必选	参数类型	描述
force	否	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-60 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	是否必选	参数类型	描述
Content-Type	是	String	<p>目前支持三种类型的PATCH请求方法的操作，参考《使用JSON合并patch更新Deployment》。</p> <ol style="list-style-type: none">1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

表 5-61 请求 Body 参数

参数	是否必选	参数类型	描述
-	是	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

响应参数

状态码： 200

表 5-62 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
binaryData	Map<String,String>	BinaryData contains the binary data. Each key must consist of alphanumeric characters, '-', '_' or '.'. BinaryData can contain byte sequences that are not in the UTF-8 range. The keys stored in BinaryData must not overlap with the ones in the Data field, this is enforced during validation process. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-64 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-65 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

请求示例

更新ConfigMap，添加一个property_2的键值对。

```
{
  "data": {
    "property_2": "test"
  }
}
```

响应示例

状态码: 200

OK

```
{
  "apiVersion": "v1",
  "data": {
    "property_1": "test",
    "property_2": "test"
  },
  "kind": "ConfigMap",
  "metadata": {
    "creationTimestamp": "2018-09-04T03:11:29Z",
    "name": "configmap-test",
    "namespace": "namespace-test",
    "resourceVersion": "5171481",
    "selfLink": "/api/v1/namespaces/namespace-test/configmaps/configmap-test",
    "uid": "379519a3-aff0-11e8-8f17-c81fbe371a17"
  }
}
```

状态码

状态码	描述
200	OK
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

5.1.7 替换 ConfigMap

功能介绍

替换ConfigMap。

The following fields can be updated:

- metadata.labels
- metadata.annotations
- data

调用方法

请参见[如何调用API](#)。

URI

PUT /api/v1/namespaces/{namespace}/configmaps/{name}

表 5-66 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the ConfigMap
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-67 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-68 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-69 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
binaryData	否	Map<String,String>	BinaryData contains the binary data. Each key must consist of alphanumeric characters, '-', '_' or '!'. BinaryData can contain byte sequences that are not in the UTF-8 range. The keys stored in BinaryData must not overlap with the ones in the Data field, this is enforced during validation process. Using this field will require 1.10+ apiserver and kubelet.

参数	是否必选	参数类型	描述
data	否	Map<String,String>	Data contains the configuration data. Each key must consist of alphanumeric characters, '-', '_' or '!'. Values with non-UTF-8 byte sequences must use the BinaryData field. The keys stored in Data must not overlap with the keys in the BinaryData field, this is enforced during validation process.
immutable	否	Boolean	Immutable, if set to true, ensures that data stored in the ConfigMap cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-70 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names

immutable	Boolean	Immutable, if set to true, ensures that data stored in the ConfigMap cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-78 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-79 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-80 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

请求示例

将已创建ConfigMap中的data数据替换为 "property_1" : "test2" 。

```
{
  "apiVersion": "v1",
  "data": {
    "property_1": "test2"
  },
  "kind": "ConfigMap",
  "metadata": {
    "name": "configmap-test"
```

```
}  
}
```

响应示例

状态码: 200

OK

```
{  
  "apiVersion": "v1",  
  "data": {  
    "property_1": "test2"  
  },  
  "kind": "ConfigMap",  
  "metadata": {  
    "creationTimestamp": "2018-09-04T03:11:29Z",  
    "name": "configmap-test",  
    "namespace": "namespace-test",  
    "resourceVersion": "5172849",  
    "selfLink": "/api/v1/namespaces/namespace-test/configmaps/configmap-test",  
    "uid": "379519a3-aff0-11e8-8f17-c81fbe371a17"  
  }  
}
```

5.2 Pod

5.2.1 删除指定 namespace 下的 Pods

功能介绍

删除Namespace下所有Pod。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/pods

表 5-81 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-82 Query 参数

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

参数	是否必选	参数类型	描述
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-83 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-84 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-85 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-86 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-87 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-88 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-89 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.2.2 查询指定 namespace 下的 Pods

功能介绍

查询指定namespace下的Pods的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/pods

表 5-90 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-91 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

表 5-94 io.k8s.api.core.v1.Pod

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-95 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.

参数	参数类型	描述
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.

参数	参数类型	描述
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-96 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-97 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-98 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-99 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-100 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-101 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-102 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-103 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-104 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-105 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-106 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-107 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-108 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-109 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-110 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-111 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-112 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-113 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <i>metadata.name</i> , <i>metadata.namespace</i> , <i>metadata.labels['<KEY>']</i> , <i>metadata.annotations['<KEY>']</i> , <i>spec.nodeName</i> , <i>spec.serviceAccountName</i> , <i>status.hostIP</i> , <i>status.podIP</i> , <i>status.podIPs</i> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-114 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-115 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-116 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-117 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-118 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-119 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-120 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-121 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-122 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-123 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-124 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-125 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-126 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-127 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-128 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-129 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-130 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-131 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-132 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-133 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-134 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-135 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-136 io.k8s.api.core.v1.SecompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-137 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-138 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-139 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-140 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-141 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-142 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-143 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-144 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-145 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-146 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-147 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-148 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-149 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-150 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-151 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-152 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-153 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-154 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-155 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-156 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-157 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-158 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-159 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-160 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-161 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-162 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-163 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-164 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-165 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-166 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-167 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-168 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-169 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-170 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-171 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-172 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-173 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-174 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-175 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-176 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-177 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-178 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-179 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-180 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-181 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-182 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-183 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-184 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-185 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-186 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-187 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-188 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-189 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-190 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-191 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-192 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-193 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-194 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-195 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-196 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-197 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

表 5-198 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.2.3 创建 Pod

功能介绍

创建一个Pod。

说明

说明：Pod的生命周期是短暂的，Pod是用后即焚的实体。在实际使用中，请谨慎单独创建Pod，请使用Deployment、StatefulSet和Job这些控制器创建应用，从而保障应用高可用。

云容器实例中Pod规格有限制，具体的限制请参见[约束限制](#)页面的“Pod规格”部分。

当前支持使用Nvidia GPU的驱动版本为418.126和460.106，您应用程序中使用的CUDA需满足如下表所示的配套关系。CUDA与驱动的配套关系来源于Nvidia官网，详细信息请参见[CUDA Compatibility](#)。

表：NVIDIA GPU驱动与CUDA配套关系

NVIDIA GPU驱动版本	CUDA Toolkit版本
418.126	CUDA 10.1 (10.1.105)及以下
460.106	CUDA 11.2.2 Update 2 及以下

如果选择GPU加速型Pod，您需要设置Pod的**metadata.annotations**中添加**cri.cci.io/gpu-driver**字段，指定使用哪个版本显卡驱动，取值如下：

- gpu-418.126
- gpu-460.106

调用方法

请参见[如何调用API](#)。

URI

POST /api/v1/namespaces/{namespace}/pods

表 5-199 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-200 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-201 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-202 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	否	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-203 io.k8s.api.core.v1.PodSpec

参数	是否必选	参数类型	描述
activeDeadlineSeconds	否	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	否	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	否	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	是	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	否	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	否	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	否	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.

参数	是否必选	参数类型	描述
ephemeralContainers	否	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	否	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	否	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	否	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	否	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	否	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.

参数	是否必选	参数类型	描述
imagePullSecrets	否	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	否	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/

参数	是否必选	参数类型	描述
nodeName	否	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	否	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	否	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.

参数	是否必选	参数类型	描述
preemptionPolicy	否	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	否	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	否	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	否	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	是否必选	参数类型	描述
restartPolicy	否	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	否	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	否	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	否	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceName	否	String	DeprecatedServiceAccount is a depreciated alias for ServiceAccountName. Deprecated: Use serviceName instead.

参数	是否必选	参数类型	描述
serviceAccountName	否	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	否	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	否	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.

参数	是否必选	参数类型	描述
subdomain	否	String	If specified, the fully qualified Pod hostname will be "[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).svc.[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	否	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	否	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	否	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

参数	是否必选	参数类型	描述
volumes	否	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-204 io.k8s.api.core.v1.Affinity

参数	是否必选	参数类型	描述
nodeAffinity	否	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	否	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	否	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-205 io.k8s.api.core.v1.NodeAffinity

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	否	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-206 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	是否必选	参数类型	描述
preference	是	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	是否必选	参数类型	描述
weight	是	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-207 io.k8s.api.core.v1.NodeSelectorTerm

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	否	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-208 io.k8s.api.core.v1.NodeSelector

参数	是否必选	参数类型	描述
nodeSelectorTerms	是	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-209 io.k8s.api.core.v1.NodeSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	The label key that the selector applies to.
operator	是	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	是否必选	参数类型	描述
values	否	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-210 io.k8s.api.core.v1.PodAffinity

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	是否必选	参数类型	描述
<code>requiredDuringSchedulingIgnoredDuringExecution</code>	否	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each <code>podAffinityTerm</code> are intersected, i.e. all terms must be satisfied.

表 5-211 `io.k8s.api.core.v1.PodAntiAffinity`

参数	是否必选	参数类型	描述
<code>preferredDuringSchedulingIgnoredDuringExecution</code>	否	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, <code>requiredDuringSchedulingIgnoredDuringExecution</code> anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding <code>podAffinityTerm</code> ; the node(s) with the highest sum are the most preferred.

参数	是否必选	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-212 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	是否必选	参数类型	描述
podAffinityTerm	是	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	是	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-213 io.k8s.api.core.v1.PodAffinityTerm

参数	是否必选	参数类型	描述
labelSelector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	否	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"

参数	是否必选	参数类型	描述
topologyKey	是	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-214 io.k8s.api.core.v1.PodDNSConfig

参数	是否必选	参数类型	描述
nameservers	否	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	否	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	否	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-215 io.k8s.api.core.v1.PodDNSConfigOption

参数	是否必选	参数类型	描述
name	否	String	Required.

参数	是否必选	参数类型	描述
value	否	String	value is the value of the option

表 5-216 io.k8s.api.core.v1.EphemeralContainer

参数	是否必选	参数类型	描述
args	否	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	是否必选	参数类型	描述
command	否	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	否	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	否	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	否	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	是否必选	参数类型	描述
imagePullPolicy	否	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	否	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	是	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	否	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	否	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.

参数	是否必选	参数类型	描述
stdin	否	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	否	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	否	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.

参数	是否必选	参数类型	描述
terminationMessagePath	否	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	否	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	否	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	否	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	否	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.

参数	是否必选	参数类型	描述
workingDir	否	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-217 io.k8s.api.core.v1.HostAlias

参数	是否必选	参数类型	描述
hostnames	否	Array of strings	Hostnames for the above IP address.
ip	否	String	IP address of the host file entry.

表 5-218 io.k8s.api.core.v1.LocalObjectReference

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-219 io.k8s.api.core.v1.Container

参数	是否必选	参数类型	描述
args	否	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	否	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	否	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.

参数	是否必选	参数类型	描述
envFrom	否	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	否	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	否	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	否	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	否	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

参数	是否必选	参数类型	描述
name	是	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	否	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	否	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/management-compute-resources-container/
securityContext	否	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/

参数	是否必选	参数类型	描述
startupProbe	否	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	否	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	否	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

参数	是否必选	参数类型	描述
terminationMessagePath	否	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	否	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	否	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	否	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	否	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.

参数	是否必选	参数类型	描述
workingDir	否	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-220 io.k8s.api.core.v1.EnvVar

参数	是否必选	参数类型	描述
name	是	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	否	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	否	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-221 io.k8s.api.core.v1.EnvVarSource

参数	是否必选	参数类型	描述
configMapKeyRef	否	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.

参数	是否必选	参数类型	描述
fieldRef	否	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports metadata.name, metadata.namespace, <i>metadata.labels['<KEY>']</i> , <i>metadata.annotations['<KEY>']</i> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
resourceFieldRef	否	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	否	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-222 io.k8s.api.core.v1.ConfigMapKeySelector

参数	是否必选	参数类型	描述
key	是	String	The key to select.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-223 io.k8s.api.core.v1.SecretKeySelector

参数	是否必选	参数类型	描述
key	是	String	The key of the secret to select from. Must be a valid secret key.

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret or its key must be defined

表 5-224 io.k8s.api.core.v1.EnvFromSource

参数	是否必选	参数类型	描述
configMapRef	否	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	否	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	否	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-225 io.k8s.api.core.v1.ConfigMapEnvSource

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap must be defined

表 5-226 io.k8s.api.core.v1.SecretEnvSource

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret must be defined

表 5-227 io.k8s.api.core.v1.Lifecycle

参数	是否必选	参数类型	描述
postStart	否	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

参数	是否必选	参数类型	描述
preStop	否	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-228 io.k8s.api.core.v1.Handler

参数	是否必选	参数类型	描述
exec	否	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	否	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
tcpSocket	否	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-229 io.k8s.api.core.v1.ContainerPort

参数	是否必选	参数类型	描述
containerPort	是	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	否	String	What host IP to bind the external port to.
hostPort	否	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	否	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	否	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-230 io.k8s.api.core.v1.SecurityContext

参数	是否必选	参数类型	描述
allowPrivilegeEscalation	否	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN

参数	是否必选	参数类型	描述
capabilities	否	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	否	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.
procMount	否	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	否	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	否	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	否	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

参数	是否必选	参数类型	描述
runAsUser	否	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	否	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	否	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.
windowsOptions	否	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-231 io.k8s.api.core.v1.Capabilities

参数	是否必选	参数类型	描述
add	否	Array of strings	Added capabilities
drop	否	Array of strings	Removed capabilities

表 5-232 io.k8s.api.core.v1.Probe

参数	是否必选	参数类型	描述
exec	否	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	否	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	否	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	否	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	否	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	否	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	否	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	否	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-233 io.k8s.api.core.v1.ExecAction

参数	是否必选	参数类型	描述
command	否	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-234 io.k8s.api.core.v1.HTTPGetAction

参数	是否必选	参数类型	描述
host	否	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	否	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	否	String	Path to access on the HTTP server.
port	是	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	否	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-235 io.k8s.api.core.v1.HTTPHeader

参数	是否必选	参数类型	描述
name	是	String	The header field name

参数	是否必选	参数类型	描述
value	是	String	The header field value

表 5-236 io.k8s.api.core.v1.TCPSocketAction

参数	是否必选	参数类型	描述
host	否	String	Optional: Host name to connect to, defaults to the pod IP.
port	是	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-237 io.k8s.api.core.v1.VolumeDevice

参数	是否必选	参数类型	描述
devicePath	是	String	devicePath is the path inside of the container that the device will be mapped to.
name	是	String	name must match the name of a persistentVolumeClaim in the pod

表 5-238 io.k8s.api.core.v1.VolumeMount

参数	是否必选	参数类型	描述
extendPathMode	否	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	是	String	Path within the container at which the volume should be mounted. Must not contain '!'.

参数	是否必选	参数类型	描述
mountPropagation	否	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	是	String	This must match the Name of a Volume.
policy	否	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	否	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	否	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	否	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$ (VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-239 io.k8s.api.core.v1.Policy

参数	是否必选	参数类型	描述
logs	否	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-240 io.k8s.api.core.v1.Logs

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations for log.
rotate	是	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-241 io.k8s.api.core.v1.PodReadinessGate

参数	是否必选	参数类型	描述
conditionType	是	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-242 io.k8s.api.core.v1.PodSecurityContext

参数	是否必选	参数类型	描述
fsGroup	否	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>

参数	是否必选	参数类型	描述
fsGroupChangePolicy	否	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	否	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	否	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

参数	是否必选	参数类型	描述
runAsUser	否	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seLinuxOptions	否	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	否	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	否	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	否	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	否	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-243 io.k8s.api.core.v1.SELinuxOptions

参数	是否必选	参数类型	描述
level	否	String	Level is SELinux level label that applies to the container.
role	否	String	Role is a SELinux role label that applies to the container.
type	否	String	Type is a SELinux type label that applies to the container.
user	否	String	User is a SELinux user label that applies to the container.

表 5-244 io.k8s.api.core.v1.SeccompProfile

参数	是否必选	参数类型	描述
localhostProfile	否	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	是	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-245 io.k8s.api.core.v1.Sysctl

参数	是否必选	参数类型	描述
name	是	String	Name of a property to set
value	是	String	Value of a property to set

表 5-246 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	是否必选	参数类型	描述
gmsaCredentialSpec	否	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	否	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	否	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-247 io.k8s.api.core.v1.Toleration

参数	是否必选	参数类型	描述
effect	否	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	否	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.

参数	是否必选	参数类型	描述
operator	否	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	否	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	否	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-248 io.k8s.api.core.v1.TopologySpreadConstraint

参数	是否必选	参数类型	描述
labelSelector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	是否必选	参数类型	描述
maxSkew	是	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1 (zone2) would make the ActualSkew(2-0) on zone1 (zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	是	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.

参数	是否必选	参数类型	描述
whenUnsatisfiable	是	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-249 io.k8s.api.core.v1.Volume

参数	是否必选	参数类型	描述
awsElasticBlockStore	否	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

参数	是否必选	参数类型	描述
azureDisk	否	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	否	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	否	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	否	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	否	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	否	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	否	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	否	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	是否必选	参数类型	描述
ephemeral	否	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	否	io.k8s.api.core.v1.FCVolumeSource object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>

参数	是否必选	参数类型	描述
flexVolume	否	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	否	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	否	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
gitRepo	否	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	否	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	否	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

参数	是否必选	参数类型	描述
iscsi	否	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	否	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	是	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	否	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	否	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	否	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
portworxVolume	否	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	否	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API

参数	是否必选	参数类型	描述
quobyte	否	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	否	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	否	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	否	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	否	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	否	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-250 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

参数	是否必选	参数类型	描述
partition	否	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	否	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	是	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-251 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	是否必选	参数类型	描述
cachingMode	否	String	Host Caching mode: None, Read Only, Read Write.
diskName	是	String	The Name of the data disk in the blob storage
diskURI	是	String	The URI the data disk in the blob storage
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

参数	是否必选	参数类型	描述
kind	否	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-252 io.k8s.api.core.v1.AzureFileVolumeSource

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	是	String	the name of secret that contains Azure Storage Account Name and Key
shareName	是	String	Share Name

表 5-253 io.k8s.api.core.v1.CephFSVolumeSource

参数	是否必选	参数类型	描述
monitors	是	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	否	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	否	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	否	io.k8s.api.core.v1.LocalObjectReference	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	否	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-254 io.k8s.api.core.v1.CinderVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

参数	是否必选	参数类型	描述
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	是	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-255 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-256 io.k8s.api.core.v1.CSIVolumeSource

参数	是否必选	参数类型	描述
driver	是	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	否	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	否	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	否	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	是否必选	参数类型	描述
volumeAttributes	否	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-257 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	否	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-258 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	是否必选	参数类型	描述
medium	否	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	否	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-259 io.k8s.api.core.v1.EphemeralVolumeSource

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	是否必选	参数类型	描述
volumeClaimTemplate	否	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a standalone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <code><pod name>-<volume name></code> where <code><volume name></code> is the name from the <code>PodSpec.Volumes</code> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-260 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	是否必选	参数类型	描述
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	是	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-261 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	是否必选	参数类型	描述
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-262 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-263 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-264 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	是否必选	参数类型	描述
dataSource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	否	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1

参数	是否必选	参数类型	描述
volumeMode	否	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	否	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-265 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-266 io.k8s.api.core.v1.ResourceRequirements

参数	是否必选	参数类型	描述
limits	否	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	是否必选	参数类型	描述
requests	否	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-267 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	否	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-268 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	key is the label key that the selector applies to.
operator	是	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

参数	是否必选	参数类型	描述
values	否	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-269 io.k8s.api.core.v1.FCVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	否	Integer	Optional: FC target lun number
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	否	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	否	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-270 io.k8s.api.core.v1.FlexVolumeSource

参数	是否必选	参数类型	描述
driver	是	String	Driver is the name of the driver to use for this volume.

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	否	Map<String,String>	Optional: Extra command options if any.
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-271 io.k8s.api.core.v1.FlockerVolumeSource

参数	是否必选	参数类型	描述
datasetName	否	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	否	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-272 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	否	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
pdName	是	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-273 io.k8s.api.core.v1.GitRepoVolumeSource

参数	是否必选	参数类型	描述
directory	否	String	Target directory name. Must not contain or start with '!'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	是	String	Repository URL
revision	否	String	Commit hash for the specified revision.

表 5-274 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	是否必选	参数类型	描述
endpoints	是	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	是	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	否	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-275 io.k8s.api.core.v1.HostPathVolumeSource

参数	是否必选	参数类型	描述
path	是	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	否	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-276 io.k8s.api.core.v1.ISCSIVolumeSource

参数	是否必选	参数类型	描述
chapAuthDiscovery	否	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	否	Boolean	whether support iSCSI Session CHAP authentication
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	否	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface <code>[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br):[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br]</code> will be created for the connection.
iqn	是	String	Target iSCSI Qualified Name.

参数	是否必选	参数类型	描述
iscsiInterface	否	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	是	Integer	iSCSI Target Lun number.
portals	否	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	是	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-277 io.k8s.api.core.v1.LocalDirVolumeSource

参数	是否必选	参数类型	描述
sizeLimit	否	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) (Note that [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) may be empty, from the "" case in [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= 0 1 ... 9 [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br). ./[topic/body/section/</p>

参数	是否必选	参数类型	描述
			<p>table/tgroup/tbody/row/entry/p/br {""} (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= "+" "-" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= "e" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) "E" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2^63-1</p>

参数	是否必选	参数类型	描述
			<p>in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

表 5-278 io.k8s.api.core.v1.NFSVolumeSource

参数	是否必选	参数类型	描述
path	是	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	否	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	是	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-279 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	是否必选	参数类型	描述
claimName	是	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	否	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-280 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	是	String	ID that identifies Photon Controller persistent disk

表 5-281 io.k8s.api.core.v1.PortworxVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	FSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	是	String	VolumeID uniquely identifies a Portworx volume

表 5-282 io.k8s.api.core.v1.ProjectedVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	是	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-283 io.k8s.api.core.v1.VolumeProjection

参数	是否必选	参数类型	描述
configMap	否	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	否	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project
secret	否	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	否	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-284 io.k8s.api.core.v1.ConfigMapProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-285 io.k8s.api.core.v1.DownwardAPIProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-286 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	是否必选	参数类型	描述
fieldRef	否	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.

参数	是否必选	参数类型	描述
mode	否	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	是	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	否	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-287 io.k8s.api.core.v1.ObjectFieldSelector

参数	是否必选	参数类型	描述
apiVersion	否	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	是	String	Path of the field to select in the specified API version.

表 5-288 io.k8s.api.core.v1.ResourceFieldSelector

参数	是否必选	参数类型	描述
containerName	否	String	Container name: required for volumes, optional for env vars

参数	是否必选	参数类型	描述
divisor	否	String	Specifies the output format of the exposed resources, defaults to "1"
resource	是	String	Required: resource to select

表 5-289 io.k8s.api.core.v1.SecretProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret or its key must be defined

表 5-290 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	是否必选	参数类型	描述
audience	否	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	否	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	是	String	Path is the path relative to the mount point of the file to project the token into.

表 5-291 io.k8s.api.core.v1.QuobyteVolumeSource

参数	是否必选	参数类型	描述
group	否	String	Group to map volume access to Default is no group
readOnly	否	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	是	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes

参数	是否必选	参数类型	描述
tenant	否	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	否	String	User to map volume access to Defaults to serviceaccount user
volume	是	String	Volume is a string that references an already created Quobyte volume by name.

表 5-292 io.k8s.api.core.v1.RBDVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	是	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	否	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	是	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
pool	否	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	是否必选	参数类型	描述
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	否	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-293 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	是	String	The host address of the ScaleIO API Gateway.
protectionDomain	否	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	是	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	否	Boolean	Flag to enable/disable SSL communication with Gateway, default false

参数	是否必选	参数类型	描述
storageMode	否	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	否	String	The ScaleIO Storage Pool associated with the protection domain.
system	是	String	The name of the storage system as configured in ScaleIO.
volumeName	否	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-294 io.k8s.api.core.v1.SecretVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	否	Boolean	Specify whether the Secret or its keys must be defined
secretName	否	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-295 io.k8s.api.core.v1.KeyToPath

参数	是否必选	参数类型	描述
key	是	String	The key to project.
mode	否	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

参数	是否必选	参数类型	描述
path	是	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-296 io.k8s.api.core.v1.StorageOSVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	否	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.

参数	是否必选	参数类型	描述
volumeNamespace	否	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-297 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	否	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	否	String	Storage Policy Based Management (SPBM) profile name.
volumePath	是	String	Path that identifies vSphere volume vmdk

表 5-298 io.k8s.api.core.v1.PodStatus

参数	是否必选	参数类型	描述
conditions	否	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	否	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	否	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	否	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	否	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	否	String	A human readable message indicating details about why the pod is in this condition.

参数	是否必选	参数类型	描述
nominatedNodeName	否	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.

参数	是否必选	参数类型	描述
phase	否	String	<p>The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values:</p> <p>Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod.</p> <p>More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase</p>
podIP	否	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.

参数	是否必选	参数类型	描述
podIPs	否	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.
qosClass	否	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	否	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	否	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-299 io.k8s.api.core.v1.PodCondition

参数	是否必选	参数类型	描述
lastProbeTime	否	String	Last time we probed the condition.
lastTransitionTime	否	String	Last time the condition transitioned from one status to another.
message	否	String	Human-readable message indicating details about last transition.
reason	否	String	Unique, one-word, CamelCase reason for the condition's last transition.

参数	是否必选	参数类型	描述
status	是	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	是	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-300 io.k8s.api.core.v1.ContainerStatus

参数	是否必选	参数类型	描述
containerID	否	String	Container's ID in the format 'docker://<container_id>'.
image	是	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images
imageID	是	String	ImageID of the container's image.
lastState	否	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	是	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	是	Boolean	Specifies whether the container has passed its readiness probe.

参数	是否必选	参数类型	描述
restartCount	是	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	否	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	否	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-301 io.k8s.api.core.v1.ContainerState

参数	是否必选	参数类型	描述
running	否	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	否	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	否	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-302 io.k8s.api.core.v1.ContainerStateRunning

参数	是否必选	参数类型	描述
startedAt	否	String	Time at which the container was last (re-)started

表 5-303 io.k8s.api.core.v1.ContainerStateTerminated

参数	是否必选	参数类型	描述
containerID	否	String	Container's ID in the format 'docker://<container_id>'
exitCode	是	Integer	Exit status from the last termination of the container
finishedAt	否	String	Time at which the container last terminated
message	否	String	Message regarding the last termination of the container
reason	否	String	(brief) reason from the last termination of the container
signal	否	Integer	Signal from the last termination of the container
startedAt	否	String	Time at which previous execution of the container started

表 5-304 io.k8s.api.core.v1.ContainerStateWaiting

参数	是否必选	参数类型	描述
message	否	String	Message regarding why the container is not yet running.
reason	否	String	(brief) reason the container is not yet running.

表 5-305 io.k8s.api.core.v1.PodIP

参数	是否必选	参数类型	描述
ip	否	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

响应参数

状态码： 200

表 5-306 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-307 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.

参数	参数类型	描述
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "[topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).svc.[topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.

参数	参数类型	描述
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-308 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-309 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-310 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-311 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-312 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-313 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-314 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-315 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-316 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-317 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-318 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-319 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-320 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-321 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-322 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-323 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-324 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-325 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-326 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-327 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-328 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-329 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-330 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-331 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-332 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-333 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-334 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-335 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-336 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-337 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-338 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-339 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-340 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-341 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-342 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-343 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-344 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-345 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-346 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-347 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-348 io.k8s.api.core.v1.SecompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-349 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-350 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-351 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-352 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-353 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-354 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-355 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-356 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-357 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-358 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-359 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-360 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-361 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-362 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-363 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-364 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-365 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-366 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-367 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-368 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-369 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-370 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-371 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-372 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-373 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-374 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-375 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-376 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-377 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-378 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-379 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-380 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""]} (br):[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""]} (br) will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.

参数	参数类型	描述
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-381 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <pre> [/<topic ""="" "-"="" (br)="" (br).="" (br).)="" (br)[="" (international="" (note="" .="" ...="" 1="" 9="" ::="Ki" <a="" <topic="" [="" be="" body="" br="" case="" ei="" empty,="" entry="" from="" gi="" href="http://physics.nist.gov/cuu/Units/binary.html" in="" may="" mi="" of="" p="" pi="" row="" section="" see:="" system="" table="" tbody="" tgroup="" that="" the="" ti="" units;="" {""}="" ="">http://physics.nist.gov/cuu/Units/binary.html) [/<topic <="" body="" pre="" section="" table="" tgroup=""> </topic></topic></pre>

参数	参数类型	描述
		<p>tbody/row/entry/p/br {""}) (br) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br) ::= "e" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br) "E" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br)</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

表 5-382 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-383 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-384 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-385 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-386 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-387 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project

参数	参数类型	描述
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-388 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-389 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-390 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-391 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-392 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-393 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-394 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-395 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-396 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-397 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-398 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-399 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-400 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-401 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-402 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-403 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-404 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-405 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-406 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-407 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-408 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-409 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

状态码: 201

表 5-410 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-411 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints

参数	参数类型	描述
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "[topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).svc.[topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.

参数	参数类型	描述
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-412 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-413 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-414 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-415 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-416 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-417 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-418 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-419 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-420 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-421 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-422 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-423 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-424 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-425 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-426 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-427 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-428 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-429 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-430 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-431 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-432 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-433 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-434 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-435 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-436 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-437 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-438 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-439 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-440 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-441 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-442 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-443 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-444 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-445 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-446 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-447 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-448 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-449 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-450 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-451 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-452 io.k8s.api.core.v1.SecompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-453 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-454 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-455 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-456 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-457 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-458 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-459 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-460 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-461 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-462 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-463 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-464 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-465 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-466 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-467 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-468 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-469 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-470 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-471 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-472 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-473 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-474 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/management-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/management-compute-resources-container/

表 5-475 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-476 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-477 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-478 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-479 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-480 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-481 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-482 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-483 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-484 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""]} (br):[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""]} (br) will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.

参数	参数类型	描述
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-485 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) (Note that [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) may be empty, from the "" case in [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= 0 1 ... 9 [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br). .[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= "+" "-" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) [/topic/body/section/table/tgroup/</p>

参数	参数类型	描述
		<p>tbody/row/entry/p/br {""}) (br) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br) ::= "e" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br) "E" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br)</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

表 5-486 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-487 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-488 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-489 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-490 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-491 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project

参数	参数类型	描述
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-492 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-493 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-494 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-495 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-496 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-497 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-498 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-499 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-500 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-501 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-502 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-503 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-504 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-505 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-506 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-507 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-508 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-509 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-510 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-511 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-512 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-513 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

状态码: 202

表 5-514 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-515 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints

参数	参数类型	描述
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "[/topic/body/section/table/tgroup/tbody/row/entry/p/br {''}] (br).[/topic/body/section/table/tgroup/tbody/row/entry/p/br {''}] (br).[/topic/body/section/table/tgroup/tbody/row/entry/p/br {''}] (br).svc.[/topic/body/section/table/tgroup/tbody/row/entry/p/br {''}] (br)". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.

参数	参数类型	描述
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-516 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-517 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-518 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-519 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-520 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-521 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-522 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-523 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-524 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-525 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-526 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-527 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-528 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-529 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-530 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-531 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-532 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-533 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-534 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-535 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-536 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-537 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-538 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-539 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-540 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-541 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-542 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-543 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-544 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-545 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-546 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-547 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-548 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-549 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-550 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-551 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-552 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-553 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-554 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-555 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-556 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-557 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-558 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-559 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-560 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-561 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-562 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-563 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-564 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-565 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-566 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-567 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-568 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-569 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-570 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-571 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <code><pod name>-<volume name></code> where <code><volume name></code> is the name from the <code>PodSpec.Volumes</code> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-572 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-573 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-574 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-575 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-576 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-577 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-578 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-579 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-580 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-581 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-582 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-583 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-584 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-585 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-586 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-587 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-588 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""]} (br):[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""]} (br) will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.

参数	参数类型	描述
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-589 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) (Note that [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) may be empty, from the "" case in [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= 0 1 ... 9 [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br).[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br). .[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= "+" "-" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br)[/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}] (br) ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) [/topic/body/section/table/tgroup/</p>

参数	参数类型	描述
		<p>tbody/row/entry/p/br {""}) (br) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br) ::= "e" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br) "E" [/topic/body/section/table/tgroup/tbody/row/entry/p/br {""}) (br)</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than $2^{63}-1$ in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that:</p> <ol style="list-style-type: none"> No precision is lost No fractional digits will be emitted The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative. <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

表 5-590 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-591 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-592 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-593 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-594 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-595 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project

参数	参数类型	描述
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-596 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-597 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-598 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-599 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-600 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-601 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-602 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-603 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-604 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-605 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-606 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-607 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-608 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-609 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-610 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-611 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-612 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-613 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-614 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-615 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-616 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-617 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

请求示例

- 创建普通Pod，使用redis镜像，Pod资源占用CPU为0.5，内存为1024Mi。

```
{
  "apiVersion": "v1",
  "kind": "Pod",
  "metadata": {
    "labels": {
      "name": "pod-test"
    },
    "name": "pod-test"
  },
  "spec": {
    "containers": [ {
      "image": "redis",
      "imagePullPolicy": "Always",
      "name": "test",
      "resources": {
        "limits": {
          "cpu": "0.5",
          "memory": "1024Mi"
        },
        "requests": {
          "cpu": "0.5",
          "memory": "1024Mi"
        }
      }
    }
  ],
  "imagePullSecrets": [ {
    "name": "imagepull-secret"
  } ],
  "priority": 0,
  "restartPolicy": "Always"
}
```

- 创建GPU型Pod，使用gpu-418.126版本显示驱动，使用redis镜像，Pod资源占用CPU为4，内存为32Gi。

📖 说明

说明：“华北-北京四”区域，仅支持NVIDIA TeslaV100 32G显卡。“华东-上海一”可支持NVIDIA TeslaV100 32G、NVIDIA TeslaV100 16G显卡。

```
{
  "apiVersion": "v1",
  "kind": "Pod",
  "metadata": {
    "annotations": {
      "cri.cci.io/gpu-driver": "gpu-418.126"
    },
    "labels": {
      "name": "pod-test"
    },
    "name": "pod-test"
  },
  "spec": {
    "containers": [ {
      "image": "redis",
      "imagePullPolicy": "Always",
      "name": "test",

5.2.4 删除 Pod

功能介绍

删除Pod，删除前持续10s。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/pods/{name}

表 5-618 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Pod
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-619 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-620 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-621 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-622 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-623 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-624 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints

参数	参数类型	描述
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

参数	参数类型	描述
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-625 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-626 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-627 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-628 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-629 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-630 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-631 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-632 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-633 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-634 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-635 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-636 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-637 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-638 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-639 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-640 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-641 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-642 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-643 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-644 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-645 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-646 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-647 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-648 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-649 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-650 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-651 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-652 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-653 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-654 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-655 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-656 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-657 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-658 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-659 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-660 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-661 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-662 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-663 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-664 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-665 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-666 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-667 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-668 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-669 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-670 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-671 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-672 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-673 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-674 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-675 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-676 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-677 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-678 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-679 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-680 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-681 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-682 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-683 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-684 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-685 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-686 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-687 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-688 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-689 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-690 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-691 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-692 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-693 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-694 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-695 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-696 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-697 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-698 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-699 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-700 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-701 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-702 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-703 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-704 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-705 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-706 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-707 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-708 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-709 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-710 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-711 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-712 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-713 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-714 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-715 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-716 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-717 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-718 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-719 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-720 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-721 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-722 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-723 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-724 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-725 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-726 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

状态码: 202

表 5-727 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-728 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints

参数	参数类型	描述
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

参数	参数类型	描述
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-729 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-730 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-731 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-732 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-733 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-734 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-735 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-736 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-737 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-738 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-739 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-740 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-741 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-742 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-743 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-744 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-745 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-746 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-747 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-748 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-749 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-750 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-751 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-752 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-753 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-754 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-755 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-756 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-757 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-758 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-759 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-760 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-761 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-762 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-763 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-764 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-765 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-766 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-767 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-768 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-769 io.k8s.api.core.v1.SecompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-770 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-771 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-772 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-773 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-774 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	<p>FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.</p>
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	<p>Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running</p>
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	<p>GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</p>

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-775 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-776 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-777 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-778 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-779 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-780 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-781 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-782 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-783 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-784 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-785 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-786 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-787 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-788 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-789 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-790 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-791 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-792 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-793 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-794 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-795 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-796 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-797 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-798 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-799 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-800 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-801 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-802 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-803 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-804 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-805 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-806 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-807 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-808 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-809 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-810 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-811 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-812 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-813 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-814 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-815 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-816 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-817 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-818 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-819 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-820 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-821 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-822 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-823 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-824 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-825 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-826 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-827 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-828 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-829 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-830 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

5.2.5 查询 Pod

功能介绍

查询Pod的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/pods/{name}

表 5-831 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Pod
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-832 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.

参数	是否必选	参数类型	描述
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-833 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-834 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-835 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.

参数	参数类型	描述
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.

参数	参数类型	描述
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-836 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-837 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-838 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-839 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-840 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-841 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-842 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-843 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-844 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-845 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-846 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-847 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-848 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-849 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-850 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-851 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-852 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-853 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-854 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-855 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-856 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-857 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-858 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-859 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-860 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-861 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-862 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-863 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-864 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-865 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-866 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-867 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-868 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-869 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-870 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '..' and must not be a root directory.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-871 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-872 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-873 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-874 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-875 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-876 io.k8s.api.core.v1.SecompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-877 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-878 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-879 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-880 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-881 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-882 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-883 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-884 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-885 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-886 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-887 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-888 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-889 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-890 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-891 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-892 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-893 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-894 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-895 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-896 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-897 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-898 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-899 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-900 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-901 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-902 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-903 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-904 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-905 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-906 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-907 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-908 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-909 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-910 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-911 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-912 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-913 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-914 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-915 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-916 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-917 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-918 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-919 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-920 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-921 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-922 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-923 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-924 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-925 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-926 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-927 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-928 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-929 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-930 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-931 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-932 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-933 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-934 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-935 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-936 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-937 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

5.2.6 更新 Pod

功能介绍

更新Pod。

其中以下字段支持更新：

- metadata.generateName
- metadata.labels
- metadata.annotations
- spec.initContainers[*].image
- spec.containers[*].image
- spec.activeDeadlineSeconds
- spec.tolerations 其余部分不支持更新。

调用方法

请参见[如何调用API](#)。

URI

PATCH /api/v1/namespaces/{namespace}/pods/{name}

表 5-938 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Pod
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-939 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

参数	是否必选	参数类型	描述
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	否	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-940 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	是否必选	参数类型	描述
Content-Type	是	String	<p>目前支持三种类型的PATCH请求方法的操作，参考《使用JSON合并patch更新Deployment》。</p> <ol style="list-style-type: none">1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

表 5-941 请求 Body 参数

参数	是否必选	参数类型	描述
-	是	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

响应参数

状态码： 200

表 5-942 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-943 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints

参数	参数类型	描述
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

参数	参数类型	描述
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-944 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-945 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-946 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-947 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-948 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-949 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-950 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-951 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-952 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-953 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-954 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-955 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-956 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-957 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-958 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-959 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-960 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-961 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-962 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-963 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-964 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-965 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-966 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-967 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-968 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-969 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-970 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-971 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-972 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-973 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-974 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-975 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-976 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-977 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-978 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-979 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-980 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-981 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-982 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: 1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw---- If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-983 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-984 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-985 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-986 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-987 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-988 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-989 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-990 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-991 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-992 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-993 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-994 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-995 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-996 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-997 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-998 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-999 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-1000 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-1001 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-1002 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-1003 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-1004 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-1005 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-1006 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-1007 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-1008 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-1009 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-1010 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-1011 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-1012 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-1013 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-1014 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-1015 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-1016 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-1017 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than $2^{63}-1$ in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-1018 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-1019 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-1020 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-1021 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-1022 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-1023 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-1024 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-1025 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-1026 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-1027 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-1028 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-1029 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-1030 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-1031 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-1032 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-1033 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-1034 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-1035 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-1036 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-1037 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-1038 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-1039 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-1040 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-1041 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-1042 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-1043 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-1044 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-1045 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

请求示例

将Pod的labels值更新为pod-test2。

```
{
  "metadata": {
    "labels": {
      "name": "pod-test2"
    }
  }
}
```

响应示例

状态码: 200

5.2.7 替换 Pod

功能介绍

替换指定Pod。

其中以下字段支持更新：

- metadata.labels
- metadata.annotations
- spec.initContainers[*].image
- spec.containers[*].image
- spec.activeDeadlineSeconds
- spec.tolerations.tolerationSeconds 其余部分不支持更新。

调用方法

请参见[如何调用API](#)。

URI

PUT /api/v1/namespaces/{namespace}/pods/{name}

表 5-1046 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Pod
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-1047 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-1048 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-1049 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	否	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-1050 io.k8s.api.core.v1.PodSpec

参数	是否必选	参数类型	描述
activeDeadlineSeconds	否	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	否	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	否	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	是	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	否	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	否	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	否	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.

参数	是否必选	参数类型	描述
ephemeralContainers	否	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	否	Array of io.k8s.api.core.v1.HostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	否	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	否	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	否	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	否	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.

参数	是否必选	参数类型	描述
imagePullSecrets	否	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	否	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/

参数	是否必选	参数类型	描述
nodeName	否	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	否	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	否	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.

参数	是否必选	参数类型	描述
preemptionPolicy	否	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	否	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	否	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	否	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	是否必选	参数类型	描述
restartPolicy	否	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	否	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	否	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	否	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceName	否	String	DeprecatedServiceAccount is a depreciated alias for ServiceAccountName. Deprecated: Use serviceName instead.

参数	是否必选	参数类型	描述
serviceAccountName	否	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	否	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	否	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	否	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.

参数	是否必选	参数类型	描述
terminationGracePeriodSeconds	否	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	否	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	否	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	否	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-1051 io.k8s.api.core.v1.Affinity

参数	是否必选	参数类型	描述
nodeAffinity	否	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	是否必选	参数类型	描述
podAffinity	否	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	否	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-1052 io.k8s.api.core.v1.NodeAffinity

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	是否必选	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	否	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-1053 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	是否必选	参数类型	描述
preference	是	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	是	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-1054 io.k8s.api.core.v1.NodeSelectorTerm

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	否	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-1055 io.k8s.api.core.v1.NodeSelector

参数	是否必选	参数类型	描述
nodeSelectorTerms	是	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-1056 io.k8s.api.core.v1.NodeSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	The label key that the selector applies to.
operator	是	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.
values	否	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-1057 io.k8s.api.core.v1.PodAffinity

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-1058 io.k8s.api.core.v1.PodAntiAffinity

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-1059 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	是否必选	参数类型	描述
podAffinityTerm	是	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	是	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-1060 io.k8s.api.core.v1.PodAffinityTerm

参数	是否必选	参数类型	描述
labelSelector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	否	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	是	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-1061 io.k8s.api.core.v1.PodDNSConfig

参数	是否必选	参数类型	描述
nameservers	否	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	否	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	否	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-1062 io.k8s.api.core.v1.PodDNSConfigOption

参数	是否必选	参数类型	描述
name	否	String	Required.
value	否	String	value is the value of the option

表 5-1063 io.k8s.api.core.v1.EphemeralContainer

参数	是否必选	参数类型	描述
args	否	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	否	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	否	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.

参数	是否必选	参数类型	描述
envFrom	否	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	否	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	否	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	否	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	是	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	否	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.

参数	是否必选	参数类型	描述
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	否	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	否	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	否	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

参数	是否必选	参数类型	描述
targetContainerName	否	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	否	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	否	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	否	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	是否必选	参数类型	描述
volumeDevices	否	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	否	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	否	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-1064 io.k8s.api.core.v1.HostAlias

参数	是否必选	参数类型	描述
hostnames	否	Array of strings	Hostnames for the above IP address.
ip	否	String	IP address of the host file entry.

表 5-1065 io.k8s.api.core.v1.LocalObjectReference

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-1066 io.k8s.api.core.v1.Container

参数	是否必选	参数类型	描述
args	否	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	否	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	否	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.

参数	是否必选	参数类型	描述
envFrom	否	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	否	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	否	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	否	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	否	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

参数	是否必选	参数类型	描述
name	是	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	否	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	否	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/management-compute-resources-container/
securityContext	否	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/

参数	是否必选	参数类型	描述
startupProbe	否	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	否	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	否	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

参数	是否必选	参数类型	描述
terminationMessagePath	否	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	否	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	否	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	否	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	否	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.

参数	是否必选	参数类型	描述
workingDir	否	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-1067 io.k8s.api.core.v1.EnvVar

参数	是否必选	参数类型	描述
name	是	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	否	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	否	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-1068 io.k8s.api.core.v1.EnvVarSource

参数	是否必选	参数类型	描述
configMapKeyRef	否	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.

参数	是否必选	参数类型	描述
fieldRef	否	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports metadata.name, metadata.namespace, <i>metadata.labels['<KEY>']</i> , <i>metadata.annotations['<KEY>']</i> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
resourceFieldRef	否	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	否	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-1069 io.k8s.api.core.v1.ConfigMapKeySelector

参数	是否必选	参数类型	描述
key	是	String	The key to select.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-1070 io.k8s.api.core.v1.SecretKeySelector

参数	是否必选	参数类型	描述
key	是	String	The key of the secret to select from. Must be a valid secret key.

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret or its key must be defined

表 5-1071 io.k8s.api.core.v1.EnvFromSource

参数	是否必选	参数类型	描述
configMapRef	否	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	否	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	否	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-1072 io.k8s.api.core.v1.ConfigMapEnvSource

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap must be defined

表 5-1073 io.k8s.api.core.v1.SecretEnvSource

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret must be defined

表 5-1074 io.k8s.api.core.v1.Lifecycle

参数	是否必选	参数类型	描述
postStart	否	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

参数	是否必选	参数类型	描述
preStop	否	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-1075 io.k8s.api.core.v1.Handler

参数	是否必选	参数类型	描述
exec	否	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	否	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
tcpSocket	否	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-1076 io.k8s.api.core.v1.ContainerPort

参数	是否必选	参数类型	描述
containerPort	是	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	否	String	What host IP to bind the external port to.
hostPort	否	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	否	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	否	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-1077 io.k8s.api.core.v1.SecurityContext

参数	是否必选	参数类型	描述
allowPrivilegeEscalation	否	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN

参数	是否必选	参数类型	描述
capabilities	否	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	否	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.
procMount	否	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	否	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	否	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	否	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

参数	是否必选	参数类型	描述
runAsUser	否	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	否	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	否	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.
windowsOptions	否	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1078 io.k8s.api.core.v1.Capabilities

参数	是否必选	参数类型	描述
add	否	Array of strings	Added capabilities
drop	否	Array of strings	Removed capabilities

表 5-1079 io.k8s.api.core.v1.Probe

参数	是否必选	参数类型	描述
exec	否	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	否	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	否	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	否	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	否	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	否	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	否	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	否	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-1080 io.k8s.api.core.v1.ExecAction

参数	是否必选	参数类型	描述
command	否	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-1081 io.k8s.api.core.v1.HTTPGetAction

参数	是否必选	参数类型	描述
host	否	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	否	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	否	String	Path to access on the HTTP server.
port	是	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	否	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-1082 io.k8s.api.core.v1.HTTPHeader

参数	是否必选	参数类型	描述
name	是	String	The header field name

参数	是否必选	参数类型	描述
value	是	String	The header field value

表 5-1083 io.k8s.api.core.v1.TCPSocketAction

参数	是否必选	参数类型	描述
host	否	String	Optional: Host name to connect to, defaults to the pod IP.
port	是	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-1084 io.k8s.api.core.v1.VolumeDevice

参数	是否必选	参数类型	描述
devicePath	是	String	devicePath is the path inside of the container that the device will be mapped to.
name	是	String	name must match the name of a persistentVolumeClaim in the pod

表 5-1085 io.k8s.api.core.v1.VolumeMount

参数	是否必选	参数类型	描述
extendPathMode	否	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	是	String	Path within the container at which the volume should be mounted. Must not contain ':'.

参数	是否必选	参数类型	描述
mountPropagation	否	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	是	String	This must match the Name of a Volume.
policy	否	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	否	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	否	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	否	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$ (VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-1086 io.k8s.api.core.v1.Policy

参数	是否必选	参数类型	描述
logs	否	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-1087 io.k8s.api.core.v1.Logs

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations for log.
rotate	是	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-1088 io.k8s.api.core.v1.PodReadinessGate

参数	是否必选	参数类型	描述
conditionType	是	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-1089 io.k8s.api.core.v1.PodSecurityContext

参数	是否必选	参数类型	描述
fsGroup	否	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>

参数	是否必选	参数类型	描述
fsGroupChangePolicy	否	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	否	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	否	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

参数	是否必选	参数类型	描述
runAsUser	否	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seLinuxOptions	否	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	否	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	否	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	否	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	否	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1090 io.k8s.api.core.v1.SELinuxOptions

参数	是否必选	参数类型	描述
level	否	String	Level is SELinux level label that applies to the container.
role	否	String	Role is a SELinux role label that applies to the container.
type	否	String	Type is a SELinux type label that applies to the container.
user	否	String	User is a SELinux user label that applies to the container.

表 5-1091 io.k8s.api.core.v1.SeccompProfile

参数	是否必选	参数类型	描述
localhostProfile	否	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	是	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-1092 io.k8s.api.core.v1.Sysctl

参数	是否必选	参数类型	描述
name	是	String	Name of a property to set
value	是	String	Value of a property to set

表 5-1093 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	是否必选	参数类型	描述
gmsaCredentialSpec	否	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	否	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	否	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1094 io.k8s.api.core.v1.Toleration

参数	是否必选	参数类型	描述
effect	否	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	否	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.

参数	是否必选	参数类型	描述
operator	否	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	否	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	否	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-1095 io.k8s.api.core.v1.TopologySpreadConstraint

参数	是否必选	参数类型	描述
labelSelector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	是否必选	参数类型	描述
maxSkew	是	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1 (zone2) would make the ActualSkew(2-0) on zone1 (zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	是	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.

参数	是否必选	参数类型	描述
whenUnsatisfiable	是	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-1096 io.k8s.api.core.v1.Volume

参数	是否必选	参数类型	描述
awsElasticBlockStore	否	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

参数	是否必选	参数类型	描述
azureDisk	否	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	否	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	否	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	否	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	否	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	否	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	否	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	否	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	是否必选	参数类型	描述
ephemeral	否	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	否	io.k8s.api.core.v1.FCVolumeSource object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>

参数	是否必选	参数类型	描述
flexVolume	否	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	否	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	否	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
gitRepo	否	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	否	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	否	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

参数	是否必选	参数类型	描述
iscsi	否	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	否	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	是	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	否	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	否	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	否	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
portworxVolume	否	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	否	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API

参数	是否必选	参数类型	描述
quobyte	否	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	否	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	否	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	否	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	否	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	否	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-1097 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

参数	是否必选	参数类型	描述
partition	否	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	否	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	是	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-1098 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	是否必选	参数类型	描述
cachingMode	否	String	Host Caching mode: None, Read Only, Read Write.
diskName	是	String	The Name of the data disk in the blob storage
diskURI	是	String	The URI the data disk in the blob storage
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

参数	是否必选	参数类型	描述
kind	否	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-1099 io.k8s.api.core.v1.AzureFileVolumeSource

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	是	String	the name of secret that contains Azure Storage Account Name and Key
shareName	是	String	Share Name

表 5-1100 io.k8s.api.core.v1.CephFSVolumeSource

参数	是否必选	参数类型	描述
monitors	是	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	否	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	否	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	否	io.k8s.api.core.v1.LocalObjectReference	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	否	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-1101 io.k8s.api.core.v1.CinderVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

参数	是否必选	参数类型	描述
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	是	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-1102 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-1103 io.k8s.api.core.v1.CSIVolumeSource

参数	是否必选	参数类型	描述
driver	是	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	否	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	否	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	否	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	是否必选	参数类型	描述
volumeAttributes	否	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-1104 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	否	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-1105 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	是否必选	参数类型	描述
medium	否	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	否	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-1106 io.k8s.api.core.v1.EphemeralVolumeSource

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	是否必选	参数类型	描述
volumeClaimTemplate	否	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a standalone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <code><pod name>-<volume name></code> where <code><volume name></code> is the name from the <code>PodSpec.Volumes</code> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to be updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-1107 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	是否必选	参数类型	描述
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	是	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-1108 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	是否必选	参数类型	描述
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-1109 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-1110 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-1111 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	是否必选	参数类型	描述
dataSource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	否	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1

参数	是否必选	参数类型	描述
volumeMode	否	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	否	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-1112 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-1113 io.k8s.api.core.v1.ResourceRequirements

参数	是否必选	参数类型	描述
limits	否	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	是否必选	参数类型	描述
requests	否	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-1114 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	否	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-1115 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	key is the label key that the selector applies to.
operator	是	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

参数	是否必选	参数类型	描述
values	否	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-1116 io.k8s.api.core.v1.FCVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	否	Integer	Optional: FC target lun number
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	否	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	否	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-1117 io.k8s.api.core.v1.FlexVolumeSource

参数	是否必选	参数类型	描述
driver	是	String	Driver is the name of the driver to use for this volume.

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	否	Map<String,String>	Optional: Extra command options if any.
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-1118 io.k8s.api.core.v1.FlockerVolumeSource

参数	是否必选	参数类型	描述
datasetName	否	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	否	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-1119 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	否	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
pdName	是	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-1120 io.k8s.api.core.v1.GitRepoVolumeSource

参数	是否必选	参数类型	描述
directory	否	String	Target directory name. Must not contain or start with '!'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	是	String	Repository URL
revision	否	String	Commit hash for the specified revision.

表 5-1121 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	是否必选	参数类型	描述
endpoints	是	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	是	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	否	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-1122 io.k8s.api.core.v1.HostPathVolumeSource

参数	是否必选	参数类型	描述
path	是	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	否	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-1123 io.k8s.api.core.v1.ISCSIVolumeSource

参数	是否必选	参数类型	描述
chapAuthDiscovery	否	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	否	Boolean	whether support iSCSI Session CHAP authentication
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	否	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	是	String	Target iSCSI Qualified Name.
iscsiInterface	否	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	是	Integer	iSCSI Target Lun number.

参数	是否必选	参数类型	描述
portals	否	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	是	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-1124 io.k8s.api.core.v1.LocalDirVolumeSource

参数	是否必选	参数类型	描述
sizeLimit	否	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <pre>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</pre> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or</p>

参数	是否必选	参数类型	描述
			<p>suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

表 5-1125 io.k8s.api.core.v1.NFSVolumeSource

参数	是否必选	参数类型	描述
path	是	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	否	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	是	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-1126 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	是否必选	参数类型	描述
claimName	是	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	否	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-1127 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	是	String	ID that identifies Photon Controller persistent disk

表 5-1128 io.k8s.api.core.v1.PortworxVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	FSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	是	String	VolumeID uniquely identifies a Portworx volume

表 5-1129 io.k8s.api.core.v1.ProjectedVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	是	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-1130 io.k8s.api.core.v1.VolumeProjection

参数	是否必选	参数类型	描述
configMap	否	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	否	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project
secret	否	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	否	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-1131 io.k8s.api.core.v1.ConfigMapProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-1132 io.k8s.api.core.v1.DownwardAPIProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-1133 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	是否必选	参数类型	描述
fieldRef	否	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.

参数	是否必选	参数类型	描述
mode	否	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	是	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	否	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-1134 io.k8s.api.core.v1.ObjectFieldSelector

参数	是否必选	参数类型	描述
apiVersion	否	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	是	String	Path of the field to select in the specified API version.

表 5-1135 io.k8s.api.core.v1.ResourceFieldSelector

参数	是否必选	参数类型	描述
containerName	否	String	Container name: required for volumes, optional for env vars

参数	是否必选	参数类型	描述
divisor	否	String	Specifies the output format of the exposed resources, defaults to "1"
resource	是	String	Required: resource to select

表 5-1136 io.k8s.api.core.v1.SecretProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret or its key must be defined

表 5-1137 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	是否必选	参数类型	描述
audience	否	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	否	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	是	String	Path is the path relative to the mount point of the file to project the token into.

表 5-1138 io.k8s.api.core.v1.QuobyteVolumeSource

参数	是否必选	参数类型	描述
group	否	String	Group to map volume access to Default is no group
readOnly	否	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	是	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes

参数	是否必选	参数类型	描述
tenant	否	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	否	String	User to map volume access to Defaults to serviceaccount user
volume	是	String	Volume is a string that references an already created Quobyte volume by name.

表 5-1139 io.k8s.api.core.v1.RBDVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	是	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	否	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	是	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
pool	否	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	是否必选	参数类型	描述
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	否	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-1140 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	是	String	The host address of the ScaleIO API Gateway.
protectionDomain	否	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	是	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	否	Boolean	Flag to enable/disable SSL communication with Gateway, default false

参数	是否必选	参数类型	描述
storageMode	否	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	否	String	The ScaleIO Storage Pool associated with the protection domain.
system	是	String	The name of the storage system as configured in ScaleIO.
volumeName	否	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-1141 io.k8s.api.core.v1.SecretVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	否	Boolean	Specify whether the Secret or its keys must be defined
secretName	否	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-1142 io.k8s.api.core.v1.KeyToPath

参数	是否必选	参数类型	描述
key	是	String	The key to project.
mode	否	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

参数	是否必选	参数类型	描述
path	是	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-1143 io.k8s.api.core.v1.StorageOSVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	否	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.

参数	是否必选	参数类型	描述
volumeNamespace	否	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-1144 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	否	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	否	String	Storage Policy Based Management (SPBM) profile name.
volumePath	是	String	Path that identifies vSphere volume vmk

表 5-1145 io.k8s.api.core.v1.PodStatus

参数	是否必选	参数类型	描述
conditions	否	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	否	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	否	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	否	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	否	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	否	String	A human readable message indicating details about why the pod is in this condition.

参数	是否必选	参数类型	描述
nominatedNodeName	否	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.

参数	是否必选	参数类型	描述
phase	否	String	<p>The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values:</p> <p>Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod.</p> <p>More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase</p>
podIP	否	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.

参数	是否必选	参数类型	描述
podIPs	否	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.
qosClass	否	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	否	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	否	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-1146 io.k8s.api.core.v1.PodCondition

参数	是否必选	参数类型	描述
lastProbeTime	否	String	Last time we probed the condition.
lastTransitionTime	否	String	Last time the condition transitioned from one status to another.
message	否	String	Human-readable message indicating details about last transition.
reason	否	String	Unique, one-word, CamelCase reason for the condition's last transition.

参数	是否必选	参数类型	描述
status	是	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	是	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-1147 io.k8s.api.core.v1.ContainerStatus

参数	是否必选	参数类型	描述
containerID	否	String	Container's ID in the format 'docker://<container_id>'.
image	是	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images
imageID	是	String	ImageID of the container's image.
lastState	否	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	是	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	是	Boolean	Specifies whether the container has passed its readiness probe.

参数	是否必选	参数类型	描述
restartCount	是	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	否	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	否	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-1148 io.k8s.api.core.v1.ContainerState

参数	是否必选	参数类型	描述
running	否	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	否	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	否	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-1149 io.k8s.api.core.v1.ContainerStateRunning

参数	是否必选	参数类型	描述
startedAt	否	String	Time at which the container was last (re-)started

表 5-1150 io.k8s.api.core.v1.ContainerStateTerminated

参数	是否必选	参数类型	描述
containerID	否	String	Container's ID in the format 'docker://<container_id>'
exitCode	是	Integer	Exit status from the last termination of the container
finishedAt	否	String	Time at which the container last terminated
message	否	String	Message regarding the last termination of the container
reason	否	String	(brief) reason from the last termination of the container
signal	否	Integer	Signal from the last termination of the container
startedAt	否	String	Time at which previous execution of the container started

表 5-1151 io.k8s.api.core.v1.ContainerStateWaiting

参数	是否必选	参数类型	描述
message	否	String	Message regarding why the container is not yet running.
reason	否	String	(brief) reason the container is not yet running.

表 5-1152 io.k8s.api.core.v1.PodIP

参数	是否必选	参数类型	描述
ip	否	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

响应参数

状态码： 200

表 5-1153 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-1154 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.

参数	参数类型	描述
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerNa me	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityConte xt	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccoun t	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccoun tName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

参数	参数类型	描述
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-1155 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-1156 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-1157 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-1158 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-1159 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-1160 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-1161 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-1162 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-1163 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-1164 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-1165 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-1166 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-1167 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-1168 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-1169 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-1170 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-1171 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-1172 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-1173 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-1174 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-1175 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-1176 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-1177 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-1178 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-1179 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-1180 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-1181 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1182 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-1183 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-1184 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-1185 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-1186 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-1187 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-1188 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-1189 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '/'. Must not contain '..'. Must not contain ':'. Must not contain '*'. Must not contain '?'. Must not contain '['. Must not contain ']'. Must not contain '&'. Must not contain '='. Must not contain '". Must not contain ''.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-1190 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-1191 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-1192 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-1193 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: 1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw---- If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1194 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-1195 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-1196 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-1197 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1198 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-1199 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-1200 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-1201 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-1202 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-1203 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-1204 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-1205 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-1206 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-1207 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-1208 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-1209 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-1210 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-1211 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-1212 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-1213 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-1214 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-1215 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-1216 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-1217 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-1218 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-1219 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-1220 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-1221 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-1222 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-1223 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-1224 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-1225 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-1226 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-1227 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-1228 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than $2^{63}-1$ in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that:</p> <ol style="list-style-type: none">No precision is lostNo fractional digits will be emittedThe exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative. <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-1229 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-1230 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-1231 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-1232 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-1233 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-1234 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-1235 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-1236 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-1237 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-1238 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-1239 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-1240 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-1241 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-1242 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-1243 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-1244 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-1245 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-1246 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-1247 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-1248 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-1249 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-1250 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-1251 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-1252 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-1253 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-1254 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-1255 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-1256 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

状态码: 201

表 5-1257 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-1258 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints

参数	参数类型	描述
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

参数	参数类型	描述
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-1259 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-1260 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-1261 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-1262 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-1263 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-1264 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-1265 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-1266 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-1267 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-1268 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-1269 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-1270 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-1271 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-1272 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-1273 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-1274 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-1275 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-1276 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-1277 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-1278 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-1279 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-1280 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-1281 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-1282 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-1283 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-1284 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-1285 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1286 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-1287 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-1288 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-1289 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-1290 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-1291 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-1292 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-1293 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-1294 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-1295 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-1296 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-1297 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1298 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-1299 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-1300 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-1301 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-1302 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-1303 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-1304 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-1305 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-1306 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-1307 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-1308 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-1309 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-1310 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-1311 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-1312 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-1313 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-1314 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-1315 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-1316 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-1317 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-1318 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-1319 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-1320 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-1321 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-1322 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-1323 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-1324 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-1325 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-1326 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-1327 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-1328 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-1329 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-1330 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-1331 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-1332 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-1333 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-1334 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-1335 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-1336 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-1337 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-1338 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-1339 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-1340 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-1341 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-1342 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-1343 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-1344 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-1345 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-1346 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-1347 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-1348 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-1349 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-1350 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-1351 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-1352 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-1353 io.k8s.api.core.v1.PodStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.PodCondition objects	Current service state of pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
containerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per container in the manifest. Each entry is currently the output of <i>docker inspect</i> . More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
ephemeralContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	Status for any ephemeral containers that have run in this pod. This field is alpha-level and is only populated by servers that enable the EphemeralContainers feature.
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
initContainerStatuses	Array of io.k8s.api.core.v1.ContainerStatus objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-and-container-status
message	String	A human readable message indicating details about why the pod is in this condition.

参数	参数类型	描述
nominatedNodeName	String	nominatedNodeName is set only when this pod preempts other pods on the node, but it cannot be scheduled right away as preemption victims receive their graceful termination periods. This field does not guarantee that the pod will be scheduled on this node. Scheduler may decide to place the pod elsewhere if other nodes become available sooner. Scheduler may also decide to give the resources on this node to a higher priority pod that is created after preemption. As a result, this field may be different than PodSpec.nodeName when the pod is scheduled.
phase	String	The phase of a Pod is a simple, high-level summary of where the Pod is in its lifecycle. The conditions array, the reason and message fields, and the individual container status arrays contain more detail about the pod's status. There are five possible phase values: Pending: The pod has been accepted by the Kubernetes system, but one or more of the container images has not been created. This includes time before being scheduled as well as time spent downloading images over the network, which could take a while. Running: The pod has been bound to a node, and all of the containers have been created. At least one container is still running, or is in the process of starting or restarting. Succeeded: All containers in the pod have terminated in success, and will not be restarted. Failed: All containers in the pod have terminated, and at least one container has terminated in failure. The container either exited with non-zero status or was terminated by the system. Unknown: For some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-phase
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
podIPs	Array of io.k8s.api.core.v1.PodIP objects	podIPs holds the IP addresses allocated to the pod. If this field is specified, the 0th entry must match the podIP field. Pods may be allocated at most 1 value for each of IPv4 and IPv6. This list is empty if no IPs have been allocated yet.

参数	参数类型	描述
qosClass	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements See PodQOSClass type for available QOS classes More info: https://git.k8s.io/community/contributors/design-proposals/node/resource-qos.md
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'Evicted'
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

表 5-1354 io.k8s.api.core.v1.PodCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
status	String	Status is the status of the condition. Can be True, False, Unknown. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions
type	String	Type is the type of the condition. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#pod-conditions

表 5-1355 io.k8s.api.core.v1.ContainerStatus

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'.
image	String	The image the container is running. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imageID	String	ImageID of the container's image.
lastState	io.k8s.api.core.v1.ContainerState object	Details about the container's last termination condition.
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
ready	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. But those containers are subject to garbage collection. This value will get capped at 5 by GC.
started	Boolean	Specifies whether the container has passed its startup probe. Initialized as false, becomes true after startupProbe is considered successful. Resets to false when the container is restarted, or if kubelet loses state temporarily. Is always true when no startupProbe is defined.
state	io.k8s.api.core.v1.ContainerState object	Details about the container's current condition.

表 5-1356 io.k8s.api.core.v1.ContainerState

参数	参数类型	描述
running	io.k8s.api.core.v1.ContainerStateRunning object	Details about a running container
terminated	io.k8s.api.core.v1.ContainerStateTerminated object	Details about a terminated container
waiting	io.k8s.api.core.v1.ContainerStateWaiting object	Details about a waiting container

表 5-1357 io.k8s.api.core.v1.ContainerStateRunning

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started

表 5-1358 io.k8s.api.core.v1.ContainerStateTerminated

参数	参数类型	描述
containerID	String	Container's ID in the format 'docker://<container_id>'
exitCode	Integer	Exit status from the last termination of the container
finishedAt	String	Time at which the container last terminated
message	String	Message regarding the last termination of the container
reason	String	(brief) reason from the last termination of the container
signal	Integer	Signal from the last termination of the container
startedAt	String	Time at which previous execution of the container started

表 5-1359 io.k8s.api.core.v1.ContainerStateWaiting

参数	参数类型	描述
message	String	Message regarding why the container is not yet running.
reason	String	(brief) reason the container is not yet running.

表 5-1360 io.k8s.api.core.v1.PodIP

参数	参数类型	描述
ip	String	ip is an IP address (IPv4 or IPv6) assigned to the pod

请求示例

将已创建Pod的镜像替换为"redis:latest"。

```
{

功能介绍

进入容器执行命令。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/pods/{name}/exec

表 5-1361 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the PodExecOptions
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-1362 Query 参数

参数	是否必选	参数类型	描述
command	否	String	Command is the remote command to execute. argv array. Not executed within a shell.
container	否	String	Container in which to execute the command. Defaults to only container if there is only one container in the pod.
stderr	否	Boolean	Redirect the standard error stream of the pod for this call. Defaults to true.
stdin	否	Boolean	Redirect the standard input stream of the pod for this call. Defaults to false.
stdout	否	Boolean	Redirect the standard output stream of the pod for this call. Defaults to true.
tty	否	Boolean	TTY if true indicates that a tty will be allocated for the exec call. Defaults to false.

请求参数

表 5-1363 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

无

5.2.10 查询 Pod 日志

功能介绍

查询Pod的日志。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/pods/{name}/log

表 5-1367 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Pod
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-1368 Query 参数

参数	是否必选	参数类型	描述
container	否	String	The container for which to stream logs. Defaults to only container if there is one container in the pod.
follow	否	Boolean	Follow the log stream of the pod. Defaults to false.

参数	是否必选	参数类型	描述
<code>insecureSkipTLSVerifyBackend</code>	否	Boolean	<code>insecureSkipTLSVerifyBackend</code> indicates that the apiserver should not confirm the validity of the serving certificate of the backend it is connecting to. This will make the HTTPS connection between the apiserver and the backend insecure. This means the apiserver cannot verify the log data it is receiving came from the real kubelet. If the kubelet is configured to verify the apiserver's TLS credentials, it does not mean the connection to the real kubelet is vulnerable to a man in the middle attack (e.g. an attacker could not intercept the actual log data coming from the real kubelet).
<code>limitBytes</code>	否	Integer	If set, the number of bytes to read from the server before terminating the log output. This may not display a complete final line of logging, and may return slightly more or slightly less than the specified limit.
<code>pretty</code>	否	String	If 'true', then the output is pretty printed.
<code>previous</code>	否	Boolean	Return previous terminated container logs. Defaults to false.
<code>sinceSeconds</code>	否	Integer	A relative time in seconds before the current time from which to show logs. If this value precedes the time a pod was started, only logs since the pod start will be returned. If this value is in the future, no logs will be returned. Only one of <code>sinceSeconds</code> or <code>sinceTime</code> may be specified.

参数	是否必选	参数类型	描述
tailLines	否	Integer	If set, the number of lines from the end of the logs to show. If not specified, logs are shown from the creation of the container or sinceSeconds or sinceTime
timestamps	否	Boolean	If true, add an RFC3339 or RFC3339Nano timestamp at the beginning of every line of log output. Defaults to false.

请求参数

表 5-1369 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

5.2.11 查询 Pod 状态

功能介绍

查询Pod对象的状态。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/pods/{name}/status

表 5-1370 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Pod
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-1371 Query 参数

参数	是否必选	参数类型	描述
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-1372 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-1373 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.PodStatus object	Most recently observed status of the pod. This data may not be up to date. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-1374 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.

参数	参数类型	描述
hostAliases	Array of io.k8s.api.core.v1.HostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/

参数	参数类型	描述
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

参数	参数类型	描述
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.

参数	参数类型	描述
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.

参数	参数类型	描述
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-1375 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-1376 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-1377 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-1378 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-1379 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-1380 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-1381 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
