podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-6303 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-6304 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-6305 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-6306 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-6307 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-6308 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6309 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6310 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-6311 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-6312 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-6313 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-6314 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6315 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-6316 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-6317 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6318 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-6319 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-6320 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-6321 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6322 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-6323 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-6324 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-6325 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-6326 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-6327 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-6328 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6329 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-6330 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-6331 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-6332 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-6333 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-6334 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-6335 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-6336 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-6337 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-6338 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-6339 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-6340 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6341 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-6342 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-6343 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-6344 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6345 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-6346 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-6347 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	<p>FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.</p>
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	<p>Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running</p>
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	<p>GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</p>

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-6348 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-6349 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-6350 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-6351 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-6352 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-6353 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6354 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-6355 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-6356 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-6357 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-6358 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-6359 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-6360 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-6361 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6362 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-6363 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-6364 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-6365 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-6366 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-6367 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-6368 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-6369 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-6370 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-6371 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-6372 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-6373 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-6374 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-6375 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-6376 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-6377 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-6378 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-6379 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-6380 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-6381 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-6382 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6383 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-6384 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-6385 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-6386 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-6387 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6388 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-6389 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-6390 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-6391 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-6392 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-6393 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-6394 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-6395 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-6396 io.k8s.api.batch.v1.JobStatus

参数	参数类型	描述
active	Integer	The number of actively running pods.
completionTime	String	Represents time when the job was completed. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
conditions	Array of io.k8s.api.batch.v1.JobCondition objects	The latest available observations of an object's current state. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
failed	Integer	The number of pods which reached phase Failed.
startTime	String	Represents time when the job was acknowledged by the job controller. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
succeeded	Integer	The number of pods which reached phase Succeeded.

表 5-6397 io.k8s.api.batch.v1.JobCondition

参数	参数类型	描述
lastProbeTime	String	Last time the condition was checked.

参数	参数类型	描述
lastTransition Time	String	Last time the condition transit from one status to another.
message	String	Human readable message indicating details about last transition.
reason	String	(brief) reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of job condition, Complete or Failed.

请求示例

更新Job中的labels值为"app:test"。

```
{
  "metadata": {
    "labels": {
      "app": "test"
    }
  }
}
```

5.20.8 替换 Job

功能介绍

替换Job。

The following fields can be updated:

- metadata.selfLink
- metadata.resourceVersion
- metadata.generation
- metadata.creationTimestamp
- metadata.deletionTimestamp
- metadata.labels
- metadata.clusterName
- metadata.generateName
- metadata.annotations
- spec.replicas
- template.containers
- spec.restartPolicy
- spec.activeDeadlineSeconds

调用方法

请参见[如何调用API](#)。

URI

PUT /apis/batch/v1/namespaces/{namespace}/jobs/{name}

表 5-6398 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Job

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-6399 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-6400 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-6401 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.batch.v1.JobSpec object	Specification of the desired behavior of a job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	否	io.k8s.api.batch.v1.JobStatus object	Current status of a job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6402 io.k8s.api.batch.v1.JobSpec

参数	是否必选	参数类型	描述
activeDeadlineSeconds	否	Long	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer
backoffLimit	否	Integer	Specifies the number of retries before marking this job failed. Defaults to 6
completions	否	Integer	Specifies the desired number of successfully finished pods the job should be run with. Setting to nil means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/

参数	是否必选	参数类型	描述
manualSelector	否	Boolean	manualSelector controls generation of pod labels and pod selectors. Leave <i>manualSelector</i> unset unless you are certain what you are doing. When false or unset, the system pick labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see <i>manualSelector=true</i> in jobs that were created with the old <i>extensions/v1beta1</i> API. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector
parallelism	否	Integer	Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when $(.spec.completions - .status.successful) < .spec.parallelism$, i.e. when the work left to do is less than max parallelism. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over pods that should match the pod count. Normally, the system sets this field for you. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors

参数	是否必选	参数类型	描述
template	是	io.k8s.api.core.v1.PodTemplateSpec object	Describes the pod that will be created when executing a job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/job-run-to-completion/
tTlSecondsAfterFinished	否	Integer	tTlSecondsAfterFinished limits the lifetime of a Job that has finished execution (either Complete or Failed). If this field is set, tTlSecondsAfterFinished after the Job finishes, it is eligible to be automatically deleted. When the Job is being deleted, its lifecycle guarantees (e.g. finalizers) will be honored. If this field is unset, the Job won't be automatically deleted. If this field is set to zero, the Job becomes eligible to be deleted immediately after it finishes. This field is alpha-level and is only honored by servers that enable the TTLAfterFinished feature.

表 5-6403 io.k8s.api.core.v1.PodTemplateSpec

参数	是否必选	参数类型	描述
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6404 io.k8s.api.core.v1.PodSpec

参数	是否必选	参数类型	描述
activeDeadlineSeconds	否	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	否	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	否	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	是	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	否	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	否	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	否	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.

参数	是否必选	参数类型	描述
ephemeralContainers	否	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	否	Array of io.k8s.api.core.v1.HostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	否	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	否	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	否	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	否	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.

参数	是否必选	参数类型	描述
imagePullSecrets	否	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	否	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/

参数	是否必选	参数类型	描述
nodeName	否	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	否	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	否	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.

参数	是否必选	参数类型	描述
preemptionPolicy	否	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	否	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	否	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	否	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	是否必选	参数类型	描述
restartPolicy	否	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	否	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	否	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	否	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceName	否	String	DeprecatedServiceAccount is a depreciated alias for ServiceAccountName. Deprecated: Use serviceName instead.

参数	是否必选	参数类型	描述
serviceAccountName	否	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	否	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	否	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	否	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.

参数	是否必选	参数类型	描述
terminationGracePeriodSeconds	否	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	否	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	否	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	否	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-6405 io.k8s.api.core.v1.Affinity

参数	是否必选	参数类型	描述
nodeAffinity	否	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	是否必选	参数类型	描述
podAffinity	否	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	否	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-6406 io.k8s.api.core.v1.NodeAffinity

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	是否必选	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	否	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-6407 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	是否必选	参数类型	描述
preference	是	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	是	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-6408 io.k8s.api.core.v1.NodeSelectorTerm

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	否	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-6409 io.k8s.api.core.v1.NodeSelector

参数	是否必选	参数类型	描述
nodeSelectorTerms	是	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-6410 io.k8s.api.core.v1.NodeSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	The label key that the selector applies to.
operator	是	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.
values	否	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-6411 io.k8s.api.core.v1.PodAffinity

参数	是否必选	参数类型	描述
<code>preferredDuringSchedulingIgnoredDuringExecution</code>	否	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, <code>requiredDuringSchedulingIgnoredDuringExecution</code> affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding <code>podAffinityTerm</code> ; the node(s) with the highest sum are the most preferred.
<code>requiredDuringSchedulingIgnoredDuringExecution</code>	否	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each <code>podAffinityTerm</code> are intersected, i.e. all terms must be satisfied.

表 5-6412 io.k8s.api.core.v1.PodAntiAffinity

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6413 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	是否必选	参数类型	描述
podAffinityTerm	是	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	是	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-6414 io.k8s.api.core.v1.PodAffinityTerm

参数	是否必选	参数类型	描述
labelSelector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	否	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	是	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-6415 io.k8s.api.core.v1.PodDNSConfig

参数	是否必选	参数类型	描述
nameservers	否	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	否	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	否	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-6416 io.k8s.api.core.v1.PodDNSConfigOption

参数	是否必选	参数类型	描述
name	否	String	Required.
value	否	String	value is the value of the option

表 5-6417 io.k8s.api.core.v1.EphemeralContainer

参数	是否必选	参数类型	描述
args	否	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, ie: \$ \$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	否	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$ \$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	否	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.

参数	是否必选	参数类型	描述
envFrom	否	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	否	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	否	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	否	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	是	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	否	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.

参数	是否必选	参数类型	描述
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	否	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	否	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	否	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

参数	是否必选	参数类型	描述
targetContainerName	否	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	否	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	否	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	否	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	是否必选	参数类型	描述
volumeDevices	否	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	否	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	否	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6418 io.k8s.api.core.v1.HostAlias

参数	是否必选	参数类型	描述
hostnames	否	Array of strings	Hostnames for the above IP address.
ip	否	String	IP address of the host file entry.

表 5-6419 io.k8s.api.core.v1.LocalObjectReference

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-6420 io.k8s.api.core.v1.Container

参数	是否必选	参数类型	描述
args	否	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, ie: \$ \$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	否	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$ \$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	否	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.

参数	是否必选	参数类型	描述
envFrom	否	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	否	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	否	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	否	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	否	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

参数	是否必选	参数类型	描述
name	是	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	否	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	否	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/management-compute-resources-container/
securityContext	否	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/

参数	是否必选	参数类型	描述
startupProbe	否	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	否	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	否	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

参数	是否必选	参数类型	描述
terminationMessagePath	否	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	否	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	否	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	否	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	否	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.

参数	是否必选	参数类型	描述
workingDir	否	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6421 io.k8s.api.core.v1.EnvVar

参数	是否必选	参数类型	描述
name	是	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	否	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	否	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-6422 io.k8s.api.core.v1.EnvVarSource

参数	是否必选	参数类型	描述
configMapKeyRef	否	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.

参数	是否必选	参数类型	描述
fieldRef	否	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports metadata.name, metadata.namespace, <i>metadata.labels['<KEY>']</i> , <i>metadata.annotations['<KEY>']</i> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
resourceFieldRef	否	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	否	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-6423 io.k8s.api.core.v1.ConfigMapKeySelector

参数	是否必选	参数类型	描述
key	是	String	The key to select.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-6424 io.k8s.api.core.v1.SecretKeySelector

参数	是否必选	参数类型	描述
key	是	String	The key of the secret to select from. Must be a valid secret key.

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret or its key must be defined

表 5-6425 io.k8s.api.core.v1.EnvFromSource

参数	是否必选	参数类型	描述
configMapRef	否	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	否	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	否	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-6426 io.k8s.api.core.v1.ConfigMapEnvSource

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap must be defined

表 5-6427 io.k8s.api.core.v1.SecretEnvSource

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret must be defined

表 5-6428 io.k8s.api.core.v1.Lifecycle

参数	是否必选	参数类型	描述
postStart	否	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

参数	是否必选	参数类型	描述
preStop	否	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-6429 io.k8s.api.core.v1.Handler

参数	是否必选	参数类型	描述
exec	否	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	否	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
tcpSocket	否	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-6430 io.k8s.api.core.v1.ContainerPort

参数	是否必选	参数类型	描述
containerPort	是	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	否	String	What host IP to bind the external port to.
hostPort	否	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	否	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	否	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-6431 io.k8s.api.core.v1.SecurityContext

参数	是否必选	参数类型	描述
allowPrivilegeEscalation	否	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN

参数	是否必选	参数类型	描述
capabilities	否	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	否	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.
procMount	否	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	否	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	否	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	否	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

参数	是否必选	参数类型	描述
runAsUser	否	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	否	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	否	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.
windowsOptions	否	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6432 io.k8s.api.core.v1.Capabilities

参数	是否必选	参数类型	描述
add	否	Array of strings	Added capabilities
drop	否	Array of strings	Removed capabilities

表 5-6433 io.k8s.api.core.v1.Probe

参数	是否必选	参数类型	描述
exec	否	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	否	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	否	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	否	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	否	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	否	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	否	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	否	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-6434 io.k8s.api.core.v1.ExecAction

参数	是否必选	参数类型	描述
command	否	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-6435 io.k8s.api.core.v1.HTTPGetAction

参数	是否必选	参数类型	描述
host	否	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	否	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	否	String	Path to access on the HTTP server.
port	是	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	否	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-6436 io.k8s.api.core.v1.HTTPHeader

参数	是否必选	参数类型	描述
name	是	String	The header field name

参数	是否必选	参数类型	描述
value	是	String	The header field value

表 5-6437 io.k8s.api.core.v1.TCPSocketAction

参数	是否必选	参数类型	描述
host	否	String	Optional: Host name to connect to, defaults to the pod IP.
port	是	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-6438 io.k8s.api.core.v1.VolumeDevice

参数	是否必选	参数类型	描述
devicePath	是	String	devicePath is the path inside of the container that the device will be mapped to.
name	是	String	name must match the name of a persistentVolumeClaim in the pod

表 5-6439 io.k8s.api.core.v1.VolumeMount

参数	是否必选	参数类型	描述
extendPathMode	否	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	是	String	Path within the container at which the volume should be mounted. Must not contain ':'.

参数	是否必选	参数类型	描述
mountPropagation	否	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	是	String	This must match the Name of a Volume.
policy	否	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	否	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	否	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	否	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$ (VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-6440 io.k8s.api.core.v1.Policy

参数	是否必选	参数类型	描述
logs	否	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-6441 io.k8s.api.core.v1.Logs

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations for log.
rotate	是	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-6442 io.k8s.api.core.v1.PodReadinessGate

参数	是否必选	参数类型	描述
conditionType	是	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-6443 io.k8s.api.core.v1.PodSecurityContext

参数	是否必选	参数类型	描述
fsGroup	否	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>

参数	是否必选	参数类型	描述
fsGroupChangePolicy	否	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	否	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	否	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

参数	是否必选	参数类型	描述
runAsUser	否	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seLinuxOptions	否	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	否	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	否	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	否	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	否	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6444 io.k8s.api.core.v1.SELinuxOptions

参数	是否必选	参数类型	描述
level	否	String	Level is SELinux level label that applies to the container.
role	否	String	Role is a SELinux role label that applies to the container.
type	否	String	Type is a SELinux type label that applies to the container.
user	否	String	User is a SELinux user label that applies to the container.

表 5-6445 io.k8s.api.core.v1.SeccompProfile

参数	是否必选	参数类型	描述
localhostProfile	否	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	是	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-6446 io.k8s.api.core.v1.Sysctl

参数	是否必选	参数类型	描述
name	是	String	Name of a property to set
value	是	String	Value of a property to set

表 5-6447 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	是否必选	参数类型	描述
gmsaCredentialSpec	否	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
gmsaCredentialSpecName	否	String	<code>GMSACredentialSpecName</code> is the name of the GMSA credential spec to use.
runAsUserName	否	String	The <code>UserName</code> in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in <code>PodSecurityContext</code> . If set in both <code>SecurityContext</code> and <code>PodSecurityContext</code> , the value specified in <code>SecurityContext</code> takes precedence.

表 5-6448 io.k8s.api.core.v1.Toleration

参数	是否必选	参数类型	描述
effect	否	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are <code>NoSchedule</code> , <code>PreferNoSchedule</code> and <code>NoExecute</code> .
key	否	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be <code>Exists</code> ; this combination means to match all values and all keys.

参数	是否必选	参数类型	描述
operator	否	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	否	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	否	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-6449 io.k8s.api.core.v1.TopologySpreadConstraint

参数	是否必选	参数类型	描述
labelSelector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	是否必选	参数类型	描述
maxSkew	是	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1 (zone2) would make the ActualSkew(2-0) on zone1 (zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	是	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.

参数	是否必选	参数类型	描述
whenUnsatisfiable	是	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-6450 io.k8s.api.core.v1.Volume

参数	是否必选	参数类型	描述
awsElasticBlockStore	否	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

参数	是否必选	参数类型	描述
azureDisk	否	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	否	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	否	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	否	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	否	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	否	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	否	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	否	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	是否必选	参数类型	描述
ephemeral	否	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	否	io.k8s.api.core.v1.FCVolumeSource object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>

参数	是否必选	参数类型	描述
flexVolume	否	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	否	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	否	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
gitRepo	否	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	否	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	否	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

参数	是否必选	参数类型	描述
iscsi	否	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	否	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	是	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	否	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	否	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	否	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
portworxVolume	否	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	否	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API

参数	是否必选	参数类型	描述
quobyte	否	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	否	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	否	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	否	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	否	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	否	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-6451 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

参数	是否必选	参数类型	描述
partition	否	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	否	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	是	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-6452 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	是否必选	参数类型	描述
cachingMode	否	String	Host Caching mode: None, Read Only, Read Write.
diskName	是	String	The Name of the data disk in the blob storage
diskURI	是	String	The URI the data disk in the blob storage
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

参数	是否必选	参数类型	描述
kind	否	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-6453 io.k8s.api.core.v1.AzureFileVolumeSource

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	是	String	the name of secret that contains Azure Storage Account Name and Key
shareName	是	String	Share Name

表 5-6454 io.k8s.api.core.v1.CephFSVolumeSource

参数	是否必选	参数类型	描述
monitors	是	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	否	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	否	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	否	io.k8s.api.core.v1.LocalObjectReference	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	否	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-6455 io.k8s.api.core.v1.CinderVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

参数	是否必选	参数类型	描述
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	是	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-6456 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6457 io.k8s.api.core.v1.CSIVolumeSource

参数	是否必选	参数类型	描述
driver	是	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	否	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	否	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	否	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	是否必选	参数类型	描述
volumeAttributes	否	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-6458 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	否	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-6459 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	是否必选	参数类型	描述
medium	否	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	否	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-6460 io.k8s.api.core.v1.EphemeralVolumeSource

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	是否必选	参数类型	描述
volumeClaimTemplate	否	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a standalone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <code><pod name>-<volume name></code> where <code><volume name></code> is the name from the <code>PodSpec.Volumes</code> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-6461 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	是否必选	参数类型	描述
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	是	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-6462 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	是否必选	参数类型	描述
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6463 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-6464 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6465 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	是否必选	参数类型	描述
dataSource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	否	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1

参数	是否必选	参数类型	描述
volumeMode	否	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	否	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-6466 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-6467 io.k8s.api.core.v1.ResourceRequirements

参数	是否必选	参数类型	描述
limits	否	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	是否必选	参数类型	描述
requests	否	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-6468 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	否	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-6469 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	key is the label key that the selector applies to.
operator	是	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

参数	是否必选	参数类型	描述
values	否	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-6470 io.k8s.api.core.v1.FCVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	否	Integer	Optional: FC target lun number
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	否	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	否	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-6471 io.k8s.api.core.v1.FlexVolumeSource

参数	是否必选	参数类型	描述
driver	是	String	Driver is the name of the driver to use for this volume.

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	否	Map<String,String>	Optional: Extra command options if any.
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-6472 io.k8s.api.core.v1.FlockerVolumeSource

参数	是否必选	参数类型	描述
datasetName	否	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	否	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-6473 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	否	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
pdName	是	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-6474 io.k8s.api.core.v1.GitRepoVolumeSource

参数	是否必选	参数类型	描述
directory	否	String	Target directory name. Must not contain or start with '!'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	是	String	Repository URL
revision	否	String	Commit hash for the specified revision.

表 5-6475 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	是否必选	参数类型	描述
endpoints	是	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	是	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	否	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-6476 io.k8s.api.core.v1.HostPathVolumeSource

参数	是否必选	参数类型	描述
path	是	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	否	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-6477 io.k8s.api.core.v1.ISCSIVolumeSource

参数	是否必选	参数类型	描述
chapAuthDiscovery	否	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	否	Boolean	whether support iSCSI Session CHAP authentication
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	否	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	是	String	Target iSCSI Qualified Name.
iscsiInterface	否	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	是	Integer	iSCSI Target Lun number.

参数	是否必选	参数类型	描述
portals	否	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	是	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-6478 io.k8s.api.core.v1.LocalDirVolumeSource

参数	是否必选	参数类型	描述
sizeLimit	否	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or</p>

参数	是否必选	参数类型	描述
			<p>suffix) is as large as possible. The sign will be omitted unless the number is negative. Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

表 5-6479 io.k8s.api.core.v1.NFSVolumeSource

参数	是否必选	参数类型	描述
path	是	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	否	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	是	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-6480 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	是否必选	参数类型	描述
claimName	是	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	否	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-6481 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	是	String	ID that identifies Photon Controller persistent disk

表 5-6482 io.k8s.api.core.v1.PortworxVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	FSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	是	String	VolumeID uniquely identifies a Portworx volume

表 5-6483 io.k8s.api.core.v1.ProjectedVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	是	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-6484 io.k8s.api.core.v1.VolumeProjection

参数	是否必选	参数类型	描述
configMap	否	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	否	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project
secret	否	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	否	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-6485 io.k8s.api.core.v1.ConfigMapProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6486 io.k8s.api.core.v1.DownwardAPIProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-6487 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	是否必选	参数类型	描述
fieldRef	否	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.

参数	是否必选	参数类型	描述
mode	否	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	是	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	否	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-6488 io.k8s.api.core.v1.ObjectFieldSelector

参数	是否必选	参数类型	描述
apiVersion	否	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	是	String	Path of the field to select in the specified API version.

表 5-6489 io.k8s.api.core.v1.ResourceFieldSelector

参数	是否必选	参数类型	描述
containerName	否	String	Container name: required for volumes, optional for env vars

参数	是否必选	参数类型	描述
divisor	否	String	Specifies the output format of the exposed resources, defaults to "1"
resource	是	String	Required: resource to select

表 5-6490 io.k8s.api.core.v1.SecretProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret or its key must be defined

表 5-6491 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	是否必选	参数类型	描述
audience	否	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	否	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	是	String	Path is the path relative to the mount point of the file to project the token into.

表 5-6492 io.k8s.api.core.v1.QuobyteVolumeSource

参数	是否必选	参数类型	描述
group	否	String	Group to map volume access to Default is no group
readOnly	否	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	是	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes

参数	是否必选	参数类型	描述
tenant	否	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	否	String	User to map volume access to Defaults to serviceaccount user
volume	是	String	Volume is a string that references an already created Quobyte volume by name.

表 5-6493 io.k8s.api.core.v1.RBDVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	是	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	否	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	是	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
pool	否	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	是否必选	参数类型	描述
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	否	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-6494 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	是	String	The host address of the ScaleIO API Gateway.
protectionDomain	否	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	是	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	否	Boolean	Flag to enable/disable SSL communication with Gateway, default false

参数	是否必选	参数类型	描述
storageMode	否	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	否	String	The ScaleIO Storage Pool associated with the protection domain.
system	是	String	The name of the storage system as configured in ScaleIO.
volumeName	否	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-6495 io.k8s.api.core.v1.SecretVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	否	Boolean	Specify whether the Secret or its keys must be defined
secretName	否	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-6496 io.k8s.api.core.v1.KeyToPath

参数	是否必选	参数类型	描述
key	是	String	The key to project.
mode	否	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

参数	是否必选	参数类型	描述
path	是	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-6497 io.k8s.api.core.v1.StorageOSVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	否	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.

参数	是否必选	参数类型	描述
volumeNamespace	否	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-6498 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	否	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	否	String	Storage Policy Based Management (SPBM) profile name.
volumePath	是	String	Path that identifies vSphere volume vmk

表 5-6499 io.k8s.api.batch.v1.JobStatus

参数	是否必选	参数类型	描述
active	否	Integer	The number of actively running pods.

参数	是否必选	参数类型	描述
completionTime	否	String	Represents time when the job was completed. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
conditions	否	Array of io.k8s.api.batch.v1.JobCondition objects	The latest available observations of an object's current state. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
failed	否	Integer	The number of pods which reached phase Failed.
startTime	否	String	Represents time when the job was acknowledged by the job controller. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
succeeded	否	Integer	The number of pods which reached phase Succeeded.

表 5-6500 io.k8s.api.batch.v1.JobCondition

参数	是否必选	参数类型	描述
lastProbeTime	否	String	Last time the condition was checked.
lastTransitionTime	否	String	Last time the condition transit from one status to another.
message	否	String	Human readable message indicating details about last transition.
reason	否	String	(brief) reason for the condition's last transition.
status	是	String	Status of the condition, one of True, False, Unknown.
type	是	String	Type of job condition, Complete or Failed.

响应参数

状态码： 200

表 5-6501 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.batch.v1.JobSpec object	Specification of the desired behavior of a job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.batch.v1.JobStatus object	Current status of a job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6502 io.k8s.api.batch.v1.JobSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer

参数	参数类型	描述
backoffLimit	Integer	Specifies the number of retries before marking this job failed. Defaults to 6
completions	Integer	Specifies the desired number of successfully finished pods the job should be run with. Setting to nil means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
manualSelector or	Boolean	manualSelector controls generation of pod labels and pod selectors. Leave <i>manualSelector</i> unset unless you are certain what you are doing. When false or unset, the system pick labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see <i>manualSelector=true</i> in jobs that were created with the old <i>extensions/v1beta1</i> API. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector
parallelism	Integer	Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when $((.spec.completions - .status.successful) < .spec.parallelism)$, i.e. when the work left to do is less than max parallelism. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over pods that should match the pod count. Normally, the system sets this field for you. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors
template	io.k8s.api.core.v1.PodTemplateSpec object	Describes the pod that will be created when executing a job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/

参数	参数类型	描述
ttlSecondsAfterFinished	Integer	ttlSecondsAfterFinished limits the lifetime of a Job that has finished execution (either Complete or Failed). If this field is set, ttlSecondsAfterFinished after the Job finishes, it is eligible to be automatically deleted. When the Job is being deleted, its lifecycle guarantees (e.g. finalizers) will be honored. If this field is unset, the Job won't be automatically deleted. If this field is set to zero, the Job becomes eligible to be deleted immediately after it finishes. This field is alpha-level and is only honored by servers that enable the TTLAfterFinished feature.

表 5-6503 io.k8s.api.core.v1.PodTemplateSpec

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6504 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.

参数	参数类型	描述
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.

参数	参数类型	描述
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-6505 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-6506 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-6507 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-6508 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-6509 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-6510 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-6511 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6512 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6513 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-6514 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-6515 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-6516 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-6517 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6518 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-6519 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-6520 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6521 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-6522 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-6523 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-6524 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6525 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-6526 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-6527 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-6528 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-6529 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-6530 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-6531 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6532 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-6533 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-6534 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-6535 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-6536 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-6537 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-6538 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-6539 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-6540 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-6541 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-6542 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-6543 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6544 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-6545 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-6546 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-6547 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entryptpoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6548 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-6549 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-6550 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-6551 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-6552 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-6553 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-6554 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-6555 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-6556 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6557 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-6558 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-6559 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-6560 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-6561 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-6562 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6563 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-6564 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6565 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-6566 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-6567 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-6568 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-6569 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-6570 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-6571 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-6572 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-6573 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-6574 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-6575 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-6576 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-6577 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-6578 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-6579 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-6580 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-6581 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-6582 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-6583 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-6584 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-6585 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6586 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-6587 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-6588 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-6589 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-6590 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6591 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-6592 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-6593 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-6594 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-6595 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-6596 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-6597 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-6598 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-6599 io.k8s.api.batch.v1.JobStatus

参数	参数类型	描述
active	Integer	The number of actively running pods.
completionTime	String	Represents time when the job was completed. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
conditions	Array of io.k8s.api.batch.v1.JobCondition objects	The latest available observations of an object's current state. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
failed	Integer	The number of pods which reached phase Failed.
startTime	String	Represents time when the job was acknowledged by the job controller. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
succeeded	Integer	The number of pods which reached phase Succeeded.

表 5-6600 io.k8s.api.batch.v1.JobCondition

参数	参数类型	描述
lastProbeTime	String	Last time the condition was checked.

参数	参数类型	描述
lastTransition Time	String	Last time the condition transit from one status to another.
message	String	Human readable message indicating details about last transition.
reason	String	(brief) reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of job condition, Complete or Failed.

状态码： 201

表 5-6601 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.batch.v1.JobSpec object	Specification of the desired behavior of a job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.batch.v1.JobStatus object	Current status of a job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6602 io.k8s.api.batch.v1.JobSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer
backoffLimit	Integer	Specifies the number of retries before marking this job failed. Defaults to 6
completions	Integer	Specifies the desired number of successfully finished pods the job should be run with. Setting to nil means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
manualSelector	Boolean	manualSelector controls generation of pod labels and pod selectors. Leave <i>manualSelector</i> unset unless you are certain what you are doing. When false or unset, the system pick labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see <i>manualSelector=true</i> in jobs that were created with the old <i>extensions/v1beta1</i> API. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector
parallelism	Integer	Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when $((\text{.spec.completions} - \text{.status.successful}) < \text{.spec.parallelism})$, i.e. when the work left to do is less than max parallelism. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over pods that should match the pod count. Normally, the system sets this field for you. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors

参数	参数类型	描述
template	io.k8s.api.core.v1.PodTemplateSpec object	Describes the pod that will be created when executing a job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
ttlSecondsAfterFinished	Integer	ttlSecondsAfterFinished limits the lifetime of a Job that has finished execution (either Complete or Failed). If this field is set, ttlSecondsAfterFinished after the Job finishes, it is eligible to be automatically deleted. When the Job is being deleted, its lifecycle guarantees (e.g. finalizers) will be honored. If this field is unset, the Job won't be automatically deleted. If this field is set to zero, the Job becomes eligible to be deleted immediately after it finishes. This field is alpha-level and is only honored by servers that enable the TTLAfterFinished feature.

表 5-6603 io.k8s.api.core.v1.PodTemplateSpec

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6604 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints

参数	参数类型	描述
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.

参数	参数类型	描述
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

参数	参数类型	描述
readinessGate s	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClass Name	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerNa me	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityConte xt	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccoun t	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccoun tName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	参数类型	描述
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.

参数	参数类型	描述
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-6605 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-6606 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-6607 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-6608 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-6609 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-6610 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-6611 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6612 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6613 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-6614 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-6615 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

参数	参数类型	描述
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-6616 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-6617 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell

参数	参数类型	描述
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6618 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-6619 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-6620 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6621 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-6622 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <i>metadata.name</i> , <i>metadata.namespace</i> , <i>metadata.labels['<KEY>']</i> , <i>metadata.annotations['<KEY>']</i> , <i>spec.nodeName</i> , <i>spec.serviceAccountName</i> , <i>status.hostIP</i> , <i>status.podIP</i> , <i>status.podIPs</i> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-6623 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-6624 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6625 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-6626 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-6627 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-6628 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-6629 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-6630 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-6631 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6632 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-6633 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-6634 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-6635 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-6636 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-6637 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-6638 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-6639 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '..'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-6640 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-6641 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-6642 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-6643 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6644 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-6645 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-6646 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-6647 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6648 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-6649 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-6650 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-6651 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-6652 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-6653 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-6654 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-6655 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-6656 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6657 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-6658 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-6659 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-6660 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-6661 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-6662 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-6663 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-6664 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6665 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-6666 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-6667 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-6668 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-6669 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-6670 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-6671 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-6672 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-6673 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-6674 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-6675 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-6676 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-6677 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-6678 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-6679 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-6680 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-6681 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-6682 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-6683 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-6684 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-6685 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6686 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-6687 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-6688 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-6689 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-6690 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6691 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-6692 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-6693 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-6694 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-6695 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-6696 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-6697 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-6698 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-6699 io.k8s.api.batch.v1.JobStatus

参数	参数类型	描述
active	Integer	The number of actively running pods.
completionTime	String	Represents time when the job was completed. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
conditions	Array of io.k8s.api.batch.v1.JobCondition objects	The latest available observations of an object's current state. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
failed	Integer	The number of pods which reached phase Failed.
startTime	String	Represents time when the job was acknowledged by the job controller. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
succeeded	Integer	The number of pods which reached phase Succeeded.

表 5-6700 io.k8s.api.batch.v1.JobCondition

参数	参数类型	描述
lastProbeTime	String	Last time the condition was checked.

参数	参数类型	描述
lastTransition Time	String	Last time the condition transit from one status to another.
message	String	Human readable message indicating details about last transition.
reason	String	(brief) reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of job condition, Complete or Failed.

请求示例

给已创建Job中增加一个labels值"app": "test2"。

```
{
  "apiVersion": "batch/v1",
  "kind": "Job",
  "metadata": {
    "creationTimestamp": "2018-09-05T01:10:59Z",

5.20.9 查询 Job 状态

功能介绍

查询Job状态。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/batch/v1/namespaces/{namespace}/jobs/{name}/status

表 5-6701 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Job
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-6702 Query 参数

参数	是否必选	参数类型	描述
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-6703 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-6704 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.batch.v1.JobSpec object	Specification of the desired behavior of a job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.batch.v1.JobStatus object	Current status of a job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6705 io.k8s.api.batch.v1.JobSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer
backoffLimit	Integer	Specifies the number of retries before marking this job failed. Defaults to 6

参数	参数类型	描述
completions	Integer	Specifies the desired number of successfully finished pods the job should be run with. Setting to nil means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
manualSelector or	Boolean	manualSelector controls generation of pod labels and pod selectors. Leave <i>manualSelector</i> unset unless you are certain what you are doing. When false or unset, the system pick labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see <i>manualSelector=true</i> in jobs that were created with the old <i>extensions/v1beta1</i> API. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector
parallelism	Integer	Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when $(.spec.completions - .status.successful) < .spec.parallelism$, i.e. when the work left to do is less than max parallelism. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over pods that should match the pod count. Normally, the system sets this field for you. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors
template	io.k8s.api.core.v1.PodTemplateSpec object	Describes the pod that will be created when executing a job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/

参数	参数类型	描述
<code>ttlSecondsAfterFinished</code>	Integer	<code>ttlSecondsAfterFinished</code> limits the lifetime of a Job that has finished execution (either Complete or Failed). If this field is set, <code>ttlSecondsAfterFinished</code> after the Job finishes, it is eligible to be automatically deleted. When the Job is being deleted, its lifecycle guarantees (e.g. finalizers) will be honored. If this field is unset, the Job won't be automatically deleted. If this field is set to zero, the Job becomes eligible to be deleted immediately after it finishes. This field is alpha-level and is only honored by servers that enable the <code>TTLAfterFinished</code> feature.

表 5-6706 io.k8s.api.core.v1.PodTemplateSpec

参数	参数类型	描述
<code>metadata</code>	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
<code>spec</code>	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6707 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
<code>activeDeadlineSeconds</code>	Long	Optional duration in seconds the pod may be active on the node relative to <code>StartTime</code> before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
<code>affinity</code>	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
<code>automountServiceAccountToken</code>	Boolean	<code>AutomountServiceAccountToken</code> indicates whether a service account token should be automatically mounted.

参数	参数类型	描述
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.

参数	参数类型	描述
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-6708 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-6709 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-6710 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-6711 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-6712 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-6713 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-6714 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6715 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6716 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-6717 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-6718 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-6719 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-6720 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6721 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-6722 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-6723 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6724 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-6725 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-6726 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-6727 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6728 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-6729 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-6730 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-6731 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-6732 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-6733 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-6734 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6735 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-6736 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-6737 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-6738 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-6743 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-6744 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-6745 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-6746 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6747 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-6748 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-6749 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-6750 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entryptpoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6751 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-6752 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-6753 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-6754 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-6755 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-6756 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-6757 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-6758 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-6759 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6760 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-6761 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-6762 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-6763 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-6764 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-6765 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6766 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-6767 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6768 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-6769 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-6770 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-6771 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-6772 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-6773 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-6774 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-6775 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-6776 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-6777 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-6778 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-6779 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-6780 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-6781 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-6782 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-6783 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-6784 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-6785 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-6786 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-6787 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-6788 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6789 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-6790 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-6791 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-6792 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-6793 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6794 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-6795 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-6796 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-6797 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-6798 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-6799 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-6800 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-6801 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-6802 io.k8s.api.batch.v1.JobStatus

参数	参数类型	描述
active	Integer	The number of actively running pods.
completionTime	String	Represents time when the job was completed. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
conditions	Array of io.k8s.api.batch.v1.JobCondition objects	The latest available observations of an object's current state. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
failed	Integer	The number of pods which reached phase Failed.
startTime	String	Represents time when the job was acknowledged by the job controller. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
succeeded	Integer	The number of pods which reached phase Succeeded.

表 5-6803 io.k8s.api.batch.v1.JobCondition

参数	参数类型	描述
lastProbeTime	String	Last time the condition was checked.

参数	参数类型	描述
lastTransition Time	String	Last time the condition transit from one status to another.
message	String	Human readable message indicating details about last transition.
reason	String	(brief) reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of job condition, Complete or Failed.

5.21 ReplicaSet

5.21.1 查询指定 namespace 下的 ReplicaSets

功能介绍

查询命名空间下所有的ReplicaSets。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/apps/v1/namespaces/{namespace}/replicasets

表 5-6804 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-6805 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-6806 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-6807 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.apps.v1.ReplicaSet objects	List of ReplicaSets. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

表 5-6808 io.k8s.api.apps.v1.ReplicaSet

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	If the Labels of a ReplicaSet are empty, they are defaulted to be the same as the Pod(s) that the ReplicaSet manages. Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.apps.v1.ReplicaSetSpec object	Spec defines the specification of the desired behavior of the ReplicaSet. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.apps.v1.ReplicaSetStatus object	Status is the most recently observed status of the ReplicaSet. This data may be out of date by some window of time. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6809 io.k8s.api.apps.v1.ReplicaSetSpec

参数	参数类型	描述
minReadySeconds	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
replicas	Integer	Replicas is the number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Defaults to 1. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller/#what-is-a-replicationcontroller
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	Selector is a label query over pods that should match the replica count. Label keys and values that must match in order to be controlled by this replica set. It must match the pod template's labels. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors
template	io.k8s.api.core.v1.PodTemplateSpec object	Template is the object that describes the pod that will be created if insufficient replicas are detected. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#pod-template

表 5-6810 io.k8s.api.core.v1.PodTemplateSpec

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6811 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.

参数	参数类型	描述
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod

参数	参数类型	描述
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-6812 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-6813 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-6814 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-6815 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-6816 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-6817 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-6818 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6819 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6820 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-6821 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-6822 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-6823 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-6824 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6825 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-6826 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-6827 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6828 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-6829 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-6830 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-6831 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6832 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-6833 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-6834 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-6835 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-6836 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-6837 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-6838 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6839 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-6840 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-6841 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-6842 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-6847 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-6848 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-6849 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-6850 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6851 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-6852 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-6853 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-6854 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6855 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-6856 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-6857 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-6858 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-6859 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-6860 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-6861 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-6862 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-6863 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6864 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-6865 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-6866 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-6867 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-6868 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-6869 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-6870 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-6871 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6872 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-6873 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-6874 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-6875 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-6876 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-6877 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-6878 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-6879 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-6880 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-6881 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-6882 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-6883 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-6884 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-6885 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-6886 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-6887 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-6888 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-6889 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-6890 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-6891 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-6892 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6893 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-6894 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-6895 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-6896 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-6897 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6898 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-6899 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-6900 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-6901 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-6902 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-6903 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-6904 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-6905 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-6906 io.k8s.api.apps.v1.ReplicaSetStatus

参数	参数类型	描述
availableReplicas	Integer	The number of available replicas (ready for at least minReadySeconds) for this replica set.
conditions	Array of io.k8s.api.apps.v1.ReplicaSetCondition objects	Represents the latest available observations of a replica set's current state.
fullyLabeledReplicas	Integer	The number of pods that have labels matching the labels of the pod template of the replicaset.
observedGeneration	Long	ObservedGeneration reflects the generation of the most recently observed ReplicaSet.
readyReplicas	Integer	The number of ready replicas for this replica set.
replicas	Integer	Replicas is the most recently observed number of replicas. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller/#what-is-a-replicationcontroller

表 5-6907 io.k8s.api.apps.v1.ReplicaSetCondition

参数	参数类型	描述
lastTransitionTime	String	The last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of replica set condition.

表 5-6908 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.21.2 查询 ReplicaSet

功能介绍

查询ReplicaSet的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/apps/v1/namespaces/{namespace}/replicasets/{name}

表 5-6909 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the ReplicaSet
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-6910 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-6911 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-6912 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	If the Labels of a ReplicaSet are empty, they are defaulted to be the same as the Pod(s) that the ReplicaSet manages. Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.apps.v1.ReplicaSetSpec object	Spec defines the specification of the desired behavior of the ReplicaSet. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.apps.v1.ReplicaSetStatus object	Status is the most recently observed status of the ReplicaSet. This data may be out of date by some window of time. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6913 io.k8s.api.apps.v1.ReplicaSetSpec

参数	参数类型	描述
minReadySeconds	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
replicas	Integer	Replicas is the number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Defaults to 1. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller/#what-is-a-replicationcontroller

参数	参数类型	描述
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	Selector is a label query over pods that should match the replica count. Label keys and values that must match in order to be controlled by this replica set. It must match the pod template's labels. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors
template	io.k8s.api.core.v1.PodTemplateSpec object	Template is the object that describes the pod that will be created if insufficient replicas are detected. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller#pod-template

表 5-6914 io.k8s.api.core.v1.PodTemplateSpec

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-6915 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.

参数	参数类型	描述
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.

参数	参数类型	描述
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-6916 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-6917 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-6918 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-6919 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-6920 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-6921 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-6922 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6923 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-6924 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-6925 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-6926 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-6927 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-6928 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6929 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-6930 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-6931 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-6932 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-6933 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-6934 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-6935 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-6936 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-6937 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-6938 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-6939 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-6940 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-6941 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-6942 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6943 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-6944 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-6945 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-6946 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-6951 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-6952 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-6953 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-6954 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6955 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-6956 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-6957 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-6958 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-6959 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-6960 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-6961 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-6962 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-6963 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-6964 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-6965 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-6966 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-6967 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6968 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-6969 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-6970 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-6971 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-6972 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-6973 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-6974 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-6975 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-6976 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-6977 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-6978 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-6979 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-6980 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-6981 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-6982 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-6983 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-6984 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-6985 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-6986 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-6987 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-6988 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-6989 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-6990 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-6991 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-6992 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-6993 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-6994 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-6995 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-6996 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-6997 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-6998 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-6999 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-7000 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-7001 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-7002 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-7003 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-7004 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-7005 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-7006 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-7007 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-7008 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-7009 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-7010 io.k8s.api.apps.v1.ReplicaSetStatus

参数	参数类型	描述
availableReplicas	Integer	The number of available replicas (ready for at least minReadySeconds) for this replica set.
conditions	Array of io.k8s.api.apps.v1.ReplicaSetCondition objects	Represents the latest available observations of a replica set's current state.
fullyLabeledReplicas	Integer	The number of pods that have labels matching the labels of the pod template of the replicaset.
observedGeneration	Long	ObservedGeneration reflects the generation of the most recently observed ReplicaSet.
readyReplicas	Integer	The number of ready replicas for this replica set.
replicas	Integer	Replicas is the most recently observed number of replicas. More info: https://kubernetes.io/docs/concepts/workloads/controllers/replicationcontroller/#what-is-a-replicationcontroller

表 5-7011 io.k8s.api.apps.v1.ReplicaSetCondition

参数	参数类型	描述
lastTransition Time	String	The last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of replica set condition.

6 数据结构

本章描述API使用的公共参数。

6.1 请求数据结构（废弃）

表 6-1 v1.PodTemplate 数据结构说明

参数	是否必选	参数类型	描述
kind	Yes	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is PodTemplate .
apiVersion	Yes	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
metadata	Yes	metadata object	-
template	Yes	template object	-

表 6-2 v1.Pod 请求参数

参数	是否必选	参数类型	描述
kind	Yes	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is Pod .
apiVersion	Yes	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
metadata	Yes	metadata object	-
spec	Yes	spec object	-
status	No	status object	-

表 6-3 status 字段数据结构说明

参数	是否必选	参数类型	描述
phase	No	String	Current condition of the pod.
conditions	No	conditions object	Current service state of the pod.
message	No	String	A human readable message indicating details about why the pod is in this condition.
reason	No	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'OutOfDisk'
hostIP	No	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.

参数	是否必选	参数类型	描述
podIP	No	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
startTime	No	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.
containerStatuses	No	containerStatuses object	The list has one entry per container in the manifest. Each entry is currently the output of container inspect.

表 6-4 conditions 字段数据结构说明

参数	是否必选	参数类型	描述
type	No	String	Type of the condition. Currently only Ready.
status	No	String	Status of the condition. Can be True, False, or Unknown.
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
reason	No	String	Unique, one-word, CamelCase reason for the condition's last transition.
message	No	String	Human-readable message indicating details about last transition.

表 6-5 containerStatuses 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
state	No	state/lastState object	-
lastState	No	state/lastState object	-
ready	No	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	No	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. However, those containers are subject to garbage collection. This value will get capped at 5 by GC.
image	Yes	String	The image the container is running.
imageID	No	String	ID of the container's image.
containerID	No	String	Container's ID in the format 'docker://'.

表 6-6 state/lastState 字段数据结构说明

参数	是否必选	参数类型	描述
waiting	No	waiting object	-
running	No	running object	-
terminated	No	terminated object	-

表 6-7 waiting 字段数据结构说明

参数	是否必选	参数类型	描述
reason	No	String	(Brief) Reason the container is not yet running.
message	No	String	Message regarding why the container is not yet running.

表 6-8 running 字段数据结构说明

参数	是否必选	参数类型	描述
startedAt	No	String	Time at which the container was last (re-)started.

表 6-9 terminated 字段数据结构说明

参数	是否必选	参数类型	描述
startedAt	No	Integer	Exit status from the last termination of the container.
signal	No	Integer	Signal from the last termination of the container.
reason	No	String	(Brief) reason from the last termination of the container.
message	No	String	Message regarding the last termination of the container.
startedAt	No	String	Time at which previous execution of the container started.
finishedAt	No	String	Time at which the container last terminated.
containerID	No	String	Container's ID in the format 'docker://'

表 6-10 metadata 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	<p>Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated.</p> <p>0 characters < name length ≤ 253 characters.</p> <p>The name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.</p>
clusterName	No	String	<p>The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.</p> <p>说明 除了evs卷，其他类型的卷不支持</p>

参数	是否必选	参数类型	描述
initializers	No	initializers object	An initializer is a controller which enforces some system invariant at object creation time. This field is a list of initializers that have not yet acted on this object. If nil or empty, this object has been completely initialized. Otherwise, the object is considered uninitialized and is hidden (in list/watch and get calls) from clients that haven't explicitly asked to observe uninitialized objects. When an object is created, the system will populate this list with the current set of initializers. Only privileged users may set or modify this list. Once it is empty, it may not be modified further by any user.

参数	是否必选	参数类型	描述
generateName	No	String	<p>An optional prefix used by the server to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different from the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409. Instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified.</p> <p>0 characters < generated name length ≤ 253 characters.</p> <p>The generated name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.</p>

参数	是否必选	参数类型	描述
namespace	No	String	Namespace defines the space within each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. 0 characters < namespace length ≤ 63 characters. The namespace must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.
selfLink	No	String	A URL representing this object. Populated by the system. Read-only. 说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.
uid	No	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. 说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.

参数	是否必选	参数类型	描述
resourceVersion	No	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>
generation	No	Integer	<p>A sequence number representing a specific generation of the desired state. Currently only implemented by replication controllers. Populated by the system. Read-only.</p>
creationTimestamp	No	String	<p>A timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>

参数	是否必选	参数类型	描述
deletionTimestamp	No	String	RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource will be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field. Once set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. Once the resource is deleted in the API, the Kubelet will send a hard termination signal to the container. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only.
deletionGracePeriodSeconds	No	Integer	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
labels	Yes	Map[string]string	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services.

参数	是否必选	参数类型	描述
Annotations	No	Map[string]string	An unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects.
ownerReferences	No	ownerReferences object	(A newly added parameter in Kubernetes 1.3) List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
finalizers	No	Array of strings	(A newly added parameter in Kubernetes 1.3) Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed.

表 6-11 initializers 字段数据结构说明

参数	是否必选	参数类型	描述
pending	No	pending object	Pending is a list of initializers that must execute in order before this object is visible. When the last pending initializer is removed, and no failing result is set, the initializers struct will be set to nil and the object is considered as initialized and visible to all clients.
result	No	result object	If result is set with the Failure field, the object will be persisted to storage and then deleted, ensuring that other clients can observe the deletion.

表 6-12 pending 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	name of the process that is responsible for initializing this object.

表 6-13 result 字段数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
code	No	Integer	Suggested HTTP return code for this status, 0 if not set.

参数	是否必选	参数类型	描述
details	No	details object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
message	No	String	A human-readable description of the status of this operation.
metadata	Yes	metadata object	Standard list metadata.
reason	No	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	No	String	Status of the operation. One of: "Success" or "Failure".

表 6-14 details 字段数据结构说明

参数	是否必选	参数类型	描述
causes	No	causes object	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	No	String	The group attribute of the resource associated with the status StatusReason.

参数	是否必选	参数类型	描述
kind	No	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind.
name	No	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	No	Integer	If specified, the time in seconds before the operation should be retried.
uid	No	String	UID of the resource. (when there is a single resource which can be described).

表 6-15 metadata 字段数据结构说明

参数	是否必选	参数类型	描述
resourceVersion	No	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only.
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.

表 6-16 causes 字段数据结构说明

参数	是否必选	参数类型	描述
field	No	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	No	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	No	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 6-17 ownerReferences 字段数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Default to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
kind	Yes	String	Kind of the referent.

参数	是否必选	参数类型	描述
name	Yes	String	Name of the referent.
uid	No	String	UID of the referent.
controller	No	Boolean	If true, this reference points to the managing controller.

表 6-18 spec 字段数据结构说明

参数	是否必选	参数类型	描述
replicas	No	Integer	The number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Value range: ≥ 0 . Default: 1
minReadySeconds	No	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its containers crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
template	Yes	template object	-
selector	Yes	Map[string]string	A label query over pods that should match the Replicas count. If Selector is empty, it is defaulted to the labels present on the Pod template. Label keys and values that must match in order to be controlled by this replication controller, if empty defaulted to labels on Pod template.

表 6-19 status 字段数据结构说明

参数	是否必选	参数类型	描述
replicas	No	Integer	The most recently observed number of replicas.

参数	是否必选	参数类型	描述
availableReplicas	No	Integer	The number of available replicas (ready for at least minReadySeconds) for this replication controller.
readyReplicas	No	Integer	The number of ready replicas for this replication controller.
conditions	No	condition object	Represents the latest available observations of a replication controller's current state.
observedGeneration	No	Integer	Reflects the generation of the most recently observed replication controller.
FullylabeledReplicas	No	Map[string]string	-

表 6-20 template 字段数据结构说明

参数	是否必选	参数类型	描述
metadata	No	metadata object	-
spec	Yes	spec object	-

表 6-21 condition 字段数据结构说明

参数	是否必选	参数类型	描述
lastTransitionTime	No	Time	The last time the condition transitioned from one status to another.
message	No	String	A human readable message indicating details about the transition.
reason	No	String	The reason for the condition's last transition.
status	No	String	Status of the condition, one of True, False, Unknown.
type	No	String	Type of replication controller condition.

表 6-22 spec 字段数据结构说明

参数	是否必选	参数类型	描述
volumes	No	-	Not supported now.
affinity	No	affinity object	If specified, the pod's scheduling constraints 说明 不允许用户设置affinity，默认使用软反亲和
containers	Yes	containers object	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a pod. Cannot be updated.
restartPolicy	No	String	Restart policy for all containers within the pod. Value: <ul style="list-style-type: none">• Always• OnFailure• Never Default: Always.
activeDeadlineSeconds	No	Integer	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer. Value range of this parameter: > 0.
dnsPolicy	No	String	Set DNS policy for containers within the pod. Value: <ul style="list-style-type: none">• ClusterFirst• Default Default: ClusterFirst.
hostAliases	No	hostAliases object	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.

参数	是否必选	参数类型	描述
serviceAccount Name	No	String	Name of the ServiceAccount used to run this pod. 0 characters < service account name length ≤ 253 characters. The service account name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?. 说明 不支持serviceaccount,所以不支持该字段
serviceAccount	No	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
schedulerName	No	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler. 说明 不支持设置指定scheduler name
nodeName	No	String	A request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements. 0 characters < node name length ≤ 253 characters. The node name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?. 说明 不支持设置nodeName
nodeSelector	No	Object	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. 说明 不支持设置nodeSelector

参数	是否必选	参数类型	描述
automountServiceAccountToken	No	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
hostNetwork	No	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false. 说明 The hostport of the hostNetwork must be different from the containerport. 创建、更新pod时不支持使用主机网络
hostPID	No	Boolean	A flag indicating whether to use the host's pid namespace. Optional: Default to false. 说明 The hostport of the hostNetwork must be different from the containerport. 创建、更新pod时不支持使用主机PID namespaces
hostIPC	No	Boolean	A flag indicating whether to use the host's ipc namespace. Optional: Default to false. 说明 The hostport of the hostNetwork must be different from the containerport. 创建、更新pod时不支持使用主机IPC namespaces
securityContext	No	securityContext object	-
imagePullSecrets	No	imagePullSecrets object	A list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. 说明 使用的镜像是容器镜像服务界面上的“我的镜像”页签中的镜像时必须设置。

参数	是否必选	参数类型	描述
initContainers	No	containers object	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, or Liveness probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed.
hostname	No	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
subdomain	No	String	If specified, the fully qualified Pod hostname will be "<hostname>.<subdomain>.<pod namespace>.svc<cluster domain>". If not specified, the pod will not have a domainname at all.
tolerations	No	tolerations object	If specified, the pod's tolerations.

表 6-23 containers 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated. 0 characters < container name length ≤ 63 characters. The container name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.
image	Yes	String	Container image name.
command	No	Array of strings	Entrypoint array. Not executed within a shell. The container image's entrypoint is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, for example, \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated.

参数	是否必选	参数类型	描述
args	No	Array of strings	Arguments to the entrypoint. The container image's cmd is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, for example, \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated.
workingDir	No	String	Container's working directory. Defaults to Container's default. Defaults to image's default. Cannot be updated.
ports	No	ports object	List of ports to expose from the container. Cannot be updated.
env	No	env object	List of environment variables to set in the container. Cannot be updated.
envFrom	No	envFrom object	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
resources	No	resources object	Minimum resources the volume should have.

参数	是否必选	参数类型	描述
volumeMounts	No	volumeMounts object	Pod volumes to mount into the container's filesystem. Cannot be updated.
livenessProbe	No	livenessProbe object	-
readinessProbe	No	livenessProbe object	-
lifecycle	No	lifecycle object	-
terminationMessagePath	No	String	Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Defaults to /dev/termination-log. Cannot be updated.
imagePullPolicy	No	String	Image pull policy. Defaults to Always if the :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. Value: <ul style="list-style-type: none">• Always• Never• IfNotPresent
securityContext	No	securityContext object	-
stdin	No	Boolean	A flag indicating whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	是否必选	参数类型	描述
stdinOnce	No	Boolean	A flag indicating whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true, the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container process that reads from stdin will never receive an EOF. Default is false.
tty	No	Boolean	A flag indicating whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

表 6-24 securityContext 字段数据结构说明

参数	是否必选	参数类型	描述
seLinuxOptions	No	seLinuxOptions object	-
runAsUser	No	Integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Value length: > 0 characters.

参数	是否必选	参数类型	描述
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
supplementalGroups	No	Array of integers	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
fsGroup	No	Integer	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw.

表 6-25 imagePullSecrets 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name of the referent. 须知 创建应用时，使用的镜像是容器镜像服务界面上的“我的镜像”页签中的镜像，那么该参数的值必须设置为imagepull-secret。

表 6-26 hostPath 字段数据结构说明

参数	是否必选	参数类型	描述
path	No	String	Path of the directory on the host.

表 6-27 emptyDir 字段数据结构说明

参数	是否必选	参数类型	描述
medium	No	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory.

表 6-28 gitRepo 字段数据结构说明

参数	是否必选	参数类型	描述
repository	No	String	Repository URL.
revision	No	String	Commit hash for the specified revision.

表 6-29 ports 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services. 0 characters < name length ≤ 15 characters. The name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.

参数	是否必选	参数类型	描述
hostPort	No	Integer	Number of the port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this. Value range: [1, 65535].
containerPort	No	Integer	Number of the port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$. Value range: [1, 65535].
protocol	No	String	Protocol for port. Value: <ul style="list-style-type: none">• TCP• UDP Default: TCP.
hostIP	No	String	What host IP to bind the external port to.

表 6-30 env 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	No	String	Variable references $\$(VAR_NAME)$ are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The $\$(VAR_NAME)$ syntax can be escaped with a double $\$\$$, for example, $\$\(VAR_NAME) . Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	是否必选	参数类型	描述
valueFrom	No	valueFrom object	-

表 6-31 resources 字段数据结构说明

参数	是否必选	参数类型	描述
limits	No	Object	Maximum amount of compute resources allowed.
requests	No	Object	Minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. 云容器实例中Pod规格有限制，具体的限制请参见 约束限制 页面的“Pod规格”部分。

表 6-32 volumeMounts 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	This must match the Name of a Volume. 0 character < name length ≤ 253 characters. The name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.
readOnly	No	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Value: <ul style="list-style-type: none">• true• false Default: false.
mountPath	No	String	Path within the container at which the volume should be mounted. Value length: > 0 characters.

参数	是否必选	参数类型	描述
subPath	No	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

表 6-33 livenessProbe 字段数据结构说明

参数	是否必选	参数类型	描述
exec	No	exec object	-
httpGet	No	httpGet object	-
tcpSocket	No	tcpSocket object	-
initialDelaySeconds	No	Integer	Number of seconds after the container has started before liveness probes are initiated. Value range: ≥ 0 .
timeoutSeconds	No	Integer	Number of seconds after which the probe times out. Value range: ≥ 0 . Default: 1.
periodSeconds	No	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1. Value range: ≥ 0 . Default: 10.
successThreshold	No	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness. Minimum value is 1. Value range: ≥ 0 . Default: 1.

参数	是否必选	参数类型	描述
failureThreshold	No	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1. Value range: ≥ 0 . Default: 3.

表 6-34 lifecycle 字段数据结构说明

参数	是否必选	参数类型	描述
postStart	No	postStart/ preStop object	-
preStop	No	postStart/ preStop object	-

表 6-35 securityContext 字段数据结构说明

参数	是否必选	参数类型	描述
capabilities	No	capabilities object	-
privileged	No	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Value: <ul style="list-style-type: none">• true• false Default: false. 说明 Run container in privileged mode
seLinuxOptions	No	seLinuxOptions object	-

参数	是否必选	参数类型	描述
runAsUser	No	Integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Value: <ul style="list-style-type: none">• true• false

表 6-36 seLinuxOptions 字段数据结构说明

参数	是否必选	参数类型	描述
user	No	String	SELinux user label that applies to the container.
role	No	String	SELinux role label that applies to the container.
type	No	String	SELinux type label that applies to the container.
level	No	String	SELinux level label that applies to the container.

表 6-37 items 字段数据结构说明

参数	是否必选	参数类型	描述
path	No	String	Relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
fieldRef	No	fieldRef object	-
resourceFieldRef	No	resourceFieldRef object	Selects a resource of the container: only resources limits and requests. (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 6-38 valueFrom 字段数据结构说明

参数	是否必选	参数类型	描述
fieldRef	No	fieldRef object	-
resourceFieldRef	No	resourceFieldRef object	Selects a resource of the container: only resources limits and requests. (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 6-39 exec 字段数据结构说明

参数	是否必选	参数类型	描述
command	No	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply executed, it is not run inside a shell, so traditional shell instructions (' ', etc) do not work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 6-40 httpGet 字段数据结构说明

参数	是否必选	参数类型	描述
path	No	String	Path to access on the HTTP server.
port	Yes	String	Name or number of the port to access on the container. The port number must be in the range 1 to 65535. The port name must be an IANA_SVC_NAME.
host	No	String	Host name to connect to. Defaults to the pod IP address.
scheme	No	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 6-41 tcpSocket 字段数据结构说明

参数	是否必选	参数类型	描述
port	Yes	String	Number or name of the port to access on the container. The port number must be in the range 1 to 65535. The port name must be an IANA_SVC_NAME.

表 6-42 postStart/preStop 字段数据结构说明

参数	是否必选	参数类型	描述
exec	No	exec object	-
httpGet	No	httpGet object	-
tcpSocket	No	tcpSocket object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported.

表 6-43 capabilities 字段数据结构说明

参数	是否必选	参数类型	描述
add	No	add object	Added capabilities.
drop	No	add object	Removed capabilities.

表 6-44 fieldRef 字段数据结构说明

参数	是否必选	参数类型	描述
apiVersion	No	String	Version of the schema the FieldPath is written in terms of. Defaults to "v1".
fieldPath	No	String	Path of the field to select in the specified API version.

表 6-45 resourceFieldRef 字段数据结构说明

参数	是否必选	参数类型	描述
containerName	No	String	Container name: required for volumes, optional for env vars.
resource	Yes	String	Required: resource to select.
divisor	No	Integer	Specifies the output format of the exposed resources, defaults to "1".

表 6-46 add 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name of the resource.
namespaced	No	Boolean	A flag indicating whether a resource is namespaced or not. Default: false.
kind	No	String	kind of the resource.

表 6-47 affinity 字段数据结构说明

参数	是否必选	参数类型	描述
nodeAffinity	No	nodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	No	podAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	No	podAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 6-48 nodeAffinity 字段数据结构说明

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	No	preferredDuringSchedulingIgnoredDuringExecution object	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	No	requiredDuringSchedulingIgnoredDuringExecution object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 6-49 podAffinity 字段数据结构说明

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	No	preferredDuringSchedulingIgnoredDuringExecution object	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which match the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

参数	是否必选	参数类型	描述
<code>requiredDuringSchedulingIgnoredDuringExecution</code>	No	podAffinityTerm object	<p>NOT YET IMPLEMENTED. TODO: Uncomment field once it is implemented. If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system will try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each <code>podAffinityTerm</code> are intersected, i.e. all terms must be satisfied.</p> <p><code>RequiredDuringSchedulingRequiredDuringExecution []PodAffinityTerm</code> json:"requiredDuringSchedulingRequiredDuringExecution,omitempty" If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each <code>podAffinityTerm</code> are intersected, i.e. all terms must be satisfied.</p>

表 6-50 preferredDuringSchedulingIgnoredDuringExecution 字段数据结构说明

参数	是否必选	参数类型	描述
preference	No	preference object	A node selector term, associated with the corresponding weight.
weight	No	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 6-51 requiredDuringSchedulingIgnoredDuringExecution 字段数据结构说明

参数	是否必选	参数类型	描述
nodeSelectorTerms	No	preference object	Required. A list of node selector terms. The terms are ORed.

表 6-52 preference 字段数据结构说明

参数	是否必选	参数类型	描述
matchExpressions	No	matchExpressions object	Required. A list of node selector requirements. The requirements are ANDed.

表 6-53 matchExpressions 字段数据结构说明

参数	是否必选	参数类型	描述
key	No	String	The label key that the selector applies to.
operator	No	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

参数	是否必选	参数类型	描述
values	No	String	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 6-54 preferredDuringSchedulingIgnoredDuringExecution 字段数据结构说明

参数	是否必选	参数类型	描述
podAffinityTerm	No	podAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	No	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 6-55 podAffinityTerm 字段数据结构说明

参数	是否必选	参数类型	描述
labelSelector	No	labelSelector object	A label query over a set of resources, in this case pods.
namespaces	No	Array[string]	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"

参数	是否必选	参数类型	描述
topologyKey	No	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. For PreferredDuringScheduling pod anti-affinity, empty topologyKey is interpreted as "all topologies" ("all topologies" here means all the topologyKeys indicated by scheduler command-line argument --failure-domains); for affinity and for RequiredDuringScheduling pod anti-affinity, empty topologyKey is not allowed.

表 6-56 labelSelector 字段数据结构说明

参数	是否必选	参数类型	描述
matchExpressions	No	matchExpressions object	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Object	(A newly added parameter in Kubernetes 1.7) matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 6-57 matchExpressions 字段数据结构说明

参数	是否必选	参数类型	描述
key	No	String	key is the label key that the selector applies to.
operator	No	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 6-58 hostAliases 字段数据结构说明

参数	是否必选	参数类型	描述
hostnames	No	Array of strings	Hostnames for the above IP address.
ip	No	String	IP address of the host file entry.

表 6-59 envFrom 字段数据结构说明

参数	是否必选	参数类型	描述
configMapRef	No	configMapRef object	The ConfigMap to select from
prefix	No	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	No	secretRef object	-

表 6-60 configMapRef 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	Name of the referent.
optional	No	Boolean	Specify whether the ConfigMap must be defined

表 6-61 secretRef 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	Name of the referent.
optional	No	Boolean	Specify whether the ConfigMap must be defined

表 6-62 tolerations 字段数据结构说明

参数	是否必选	参数类型	描述
effect	No	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	No	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	No	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.

参数	是否必选	参数类型	描述
tolerationSeconds	No	Integer	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	No	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 6-63 DeleteOptions 数据结构说明

参数	是否必选	参数类型	描述
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is DeleteOptions.
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1.

参数	是否必选	参数类型	描述
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be a non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy.
preconditions	No	Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.

表 6-64 preconditions 字段数据结构说明

参数	是否必选	参数类型	描述
uid	No	String	Specifies the target UID.

6.2 响应数据结构（废弃）

表 6-65 Pod 响应参数

参数	参数类型	描述
kind	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	metadata object	-
spec	spec object	-
status	status object	-

表 6-66 PodList 响应参数

参数	参数类型	描述
kind	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	metadata object	-
items	Array of Pod objects	List of pods.

表 6-67 PodTemplate 响应参数

参数	参数类型	描述
kind	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	metadata object	-
template	template object	-

表 6-68 PodTemplateList 响应参数

参数	参数类型	描述
kind	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	metadata object	-
items	items object	List of pod templates.

表 6-69 items 字段数据结构说明

参数	参数类型	描述
kind	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	metadata object	-
spec	spec object	-
status	status object	-

表 6-70 status 字段数据结构说明

参数	参数类型	描述
phase	String	Current condition of the pod.
conditions	conditions object	Current service state of the pod.
message	String	A human readable message indicating details about why the pod is in this condition.
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'OutOfDisk'
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.

参数	参数类型	描述
containerStatuses	containerStatuses object	The list has one entry per container in the manifest. Each entry is currently the output of container inspect.

表 6-71 conditions 字段数据结构说明

参数	参数类型	描述
type	String	Type of the condition. Currently only Ready.
status	String	Status of the condition. Can be True, False, or Unknown.
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.
message	String	Human-readable message indicating details about last transition.

表 6-72 containerStatuses 字段数据结构说明

参数	参数类型	描述
name	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.
state	state/lastState object	-
lastState	state/lastState object	-
ready	Boolean	A flag indicating whether the container has passed its readiness probe.

参数	参数类型	描述
restartCount	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. However, those containers are subject to garbage collection. This value will get capped at 5 by GC.
image	String	Image that the container is running.
imageID	String	ID of the container's image.
containerID	String	Container's ID in the format 'docker://'.

表 6-73 state/lastState 字段数据结构说明

参数	参数类型	描述
waiting	waiting object	-
running	running object	-
terminated	terminated object	-

表 6-74 waiting 字段数据结构说明

参数	参数类型	描述
reason	String	(Brief) reason the container is not yet running.
message	String	Message regarding why the container is not yet running.

表 6-75 running 字段数据结构说明

参数	参数类型	描述
startedAt	String	Time at which the container was last (re-)started.

表 6-76 terminated 字段数据结构说明

参数	参数类型	描述
exitCode	Integer	Exit status from the last termination of the container.
signal	Integer	Signal from the last termination of the container.
reason	String	(Brief) reason from the last termination of the container.
message	String	Message regarding the last termination of the container.
startedAt	String	Time at which previous execution of the container started.
finishedAt	String	Time at which the container last terminated.
containerID	String	Container's ID in the format 'docker://'.

表 6-77 metadata 字段数据结构说明

参数	参数类型	描述
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only.

表 6-78 items 字段数据结构说明

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	metadata object	-
spec	spec object	-
status	status object	-

表 6-79 metadata 字段数据结构说明

参数	参数类型	描述
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated.
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
initializers	initializers object	<p>An initializer is a controller which enforces some system invariant at object creation time. This field is a list of initializers that have not yet acted on this object. If nil or empty, this object has been completely initialized. Otherwise, the object is considered uninitialized and is hidden (in list/watch and get calls) from clients that haven't explicitly asked to observe uninitialized objects. When an object is created, the system will populate this list with the current set of initializers. Only privileged users may set or modify this list. Once it is empty, it may not be modified further by any user.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different from the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified.</p>

参数	参数类型	描述
namespace	String	Namespace defines the space within each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated.
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only.
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients.
generation	Integer	A sequence number representing a specific generation of the desired state. Currently only implemented by replication controllers. Populated by the system. Read-only.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource will be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field. Once set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. Once the resource is deleted in the API, the Kubelet will send a hard termination signal to the container. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only.
deletionGracePeriodSeconds	Integer	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
labels	Map[string]string	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services.
Annotations	Map[string]string	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects.
ownerReferences	ownerReferences object	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed.

表 6-80 spec 字段数据结构说明

参数	参数类型	描述
replicas	Integer	Replicas is the number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Defaults to 1.

参数	参数类型	描述
selector	Object	Selector is a label query over pods that should match the Replicas count. If Selector is empty, it is defaulted to the labels present on the Pod template. Label keys and values that must match in order to be controlled by this replication controller, if empty defaulted to labels on Pod template.
minReadySeconds	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its containers crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
template	template object	-

表 6-81 status 字段数据结构说明

参数	参数类型	描述
replicas	Integer	Replicas is the most recently observed number of replicas.
availableReplicas	Integer	The number of available replicas (ready for at least minReadySeconds) for this replication controller.
readyReplicas	Integer	The number of ready replicas for this replication controller.
fullyLabeledReplicas	Integer	The number of pods that have labels matching the labels of the pod template of the replication controller.
conditions	ReplicationControllerCondition object	Represents the latest available observations of a replication controller's current state.
observedGeneration	Integer	ObservedGeneration reflects the generation of the most recently observed replication controller.

表 6-82 initializers 字段数据结构说明

参数	参数类型	描述
pending	pending object	Pending is a list of initializers that must execute in order before this object is visible. When the last pending initializer is removed, and no failing result is set, the initializers struct will be set to nil and the object is considered as initialized and visible to all clients.
result	result object	If result is set with the Failure field, the object will be persisted to storage and then deleted, ensuring that other clients can observe the deletion.

表 6-83 pending 字段数据结构说明

参数	参数类型	描述
name	String	name of the process that is responsible for initializing this object.

表 6-84 result 字段数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	details object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
message	String	A human-readable description of the status of this operation.
metadata	metadata object	Standard list metadata.
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure".

表 6-85 details 字段数据结构说明

参数	参数类型	描述
causes	causes object	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind.
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).

参数	参数类型	描述
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried.
uid	String	UID of the resource. (when there is a single resource which can be described).

表 6-86 metadata 字段数据结构说明

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only.
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.

表 6-87 causes 字段数据结构说明

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.

参数	参数类型	描述
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 6-88 ownerReferences 字段数据结构说明

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Default to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
kind	String	Kind of the referent.
name	String	Name of the referent.
uid	String	UID of the referent.
controller	Boolean	If true, this reference points to the managing controller.

表 6-89 template 字段数据结构说明

参数	参数类型	描述
metadata	metadata object	-
spec	spec object	-

表 6-90 spec 字段数据结构说明

参数	参数类型	描述
volumes	-	Not supported now.

参数	参数类型	描述
containers	containers object	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
restartPolicy	String	Restart policy for all containers within the pod. One of Always, OnFailure, Never. Default to Always.
activeDeadlineSeconds	Integer	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
dnsPolicy	String	Set DNS policy for containers within the pod. One of 'ClusterFirst' or 'Default'. Defaults to "ClusterFirst".
serviceName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceName instead.
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	参数类型	描述
securityContext	securityContext object	-
imagePullSecrets	imagePullSecrets object	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use.

表 6-91 containers 字段数据结构说明

参数	参数类型	描述
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
image	String	Container image name.
command	Array of strings	Entrypoint array. Not executed within a shell. The container image's entrypoint is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, for example, \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated.

参数	参数类型	描述
args	Array of strings	Arguments to the endpoint. The container image's cmd is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, for example, \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated.
workingDir	String	Container's working directory. Defaults to Container's default. Defaults to image's default. Cannot be updated.
ports	ports object	List of ports to expose from the container. Cannot be updated.
env	env object	List of environment variables to set in the container. Cannot be updated.
resources	resources object	Resources represents the minimum resources the volume should have.
volumeMounts	-	Not supported now.
livenessProbe	livenessProbe object	-
readinessProbe	livenessProbe object	-
lifecycle	lifecycle object	-
terminationMessagePath	String	Path at which the file to which the container's termination message will be written is mounted into the container's file system. Message written is intended to be brief final status, such as an assertion failure message. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if the latest tag is specified, or IfNotPresent otherwise. Cannot be updated.
securityContext	securityContext object	-
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true, the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container process that reads from stdin will never receive an EOF. Default is false.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

表 6-92 securityContext 字段数据结构说明

参数	参数类型	描述
seLinuxOptions	seLinuxOptions object	-

参数	参数类型	描述
runAsUser	Integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
supplementalGroups	Array of integers	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
fsGroup	Integer	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw.

表 6-93 imagePullSecrets 字段数据结构说明

参数	参数类型	描述
name	String	Name of the referent.

表 6-94 hostPath 字段数据结构说明

参数	参数类型	描述
path	String	Path of the directory on the host.

表 6-95 gitRepo 字段数据结构说明

参数	参数类型	描述
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 6-96 secret 字段数据结构说明

参数	参数类型	描述
secretName	String	SecretName is the name of a secret in the pod's namespace.

表 6-97 ports 字段数据结构说明

参数	参数类型	描述
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
hostPort	Integer	Number of the port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
containerPort	Integer	Number of the port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
protocol	String	Protocol for port. Must be UDP or TCP. Defaults to "TCP".
hostIP	String	What host IP to bind the external port to.

表 6-98 env 字段数据结构说明

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, for example, \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	valueFrom object	-

表 6-99 resources 字段数据结构说明

参数	参数类型	描述
limits	Object	Limits describes the maximum amount of compute resources allowed.
requests	Object	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value.

表 6-100 livenessProbe 字段数据结构说明

参数	参数类型	描述
exec	exec object	-
httpGet	httpGet object	-
tcpSocket	tcpSocket object	-

参数	参数类型	描述
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated.
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1.
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness. Minimum value is 1.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.

表 6-101 lifecycle 字段数据结构说明

参数	参数类型	描述
postStart	postStart/preStop object	-
preStop	postStart/preStop object	-

表 6-102 securityContext 字段数据结构说明

参数	参数类型	描述
capabilities	capabilities object	-
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Default to false.
seLinuxOptions	seLinuxOptions object	-

参数	参数类型	描述
runAsUser	Integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 6-103 seLinuxOptions 字段数据结构说明

参数	参数类型	描述
user	String	User is a SELinux user label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
level	String	Level is SELinux level label that applies to the container.

表 6-104 items 字段数据结构说明

参数	参数类型	描述
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
fieldRef	fieldRef object	-

表 6-105 valueFrom 字段数据结构说明

参数	参数类型	描述
fieldRef	fieldRef object	-
resourceFieldRef	resourceFieldRef object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 6-106 exec 字段数据结构说明

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply executed, it is not run inside a shell, so traditional shell instructions (' ', etc) do not work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 6-107 httpGet 字段数据结构说明

参数	参数类型	描述
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
host	String	Host name to connect to, defaults to the pod IP.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 6-108 tcpSocket 字段数据结构说明

参数	参数类型	描述
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 6-109 postStart/preStop 字段数据结构说明

参数	参数类型	描述
exec	exec object	-
httpGet	httpGet object	-
tcpSocket	tcpSocket object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported.

表 6-110 capabilities 字段数据结构说明

参数	参数类型	描述
add	add object	Added capabilities
drop	add object	Removed capabilities

表 6-111 fieldRef 字段数据结构说明

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1"
fieldPath	String	Path of the field to select in the specified API version.

表 6-112 resourceFieldRef 字段数据结构说明

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars.
resource	String	Required: resource to select.
divisor	Integer	Specifies the output format of the exposed resources, defaults to "1".

表 6-113 add 字段数据结构说明

参数	参数类型	描述
name	String	name is the name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not. Default: false.
kind	String	kind is the kind for the resource.

表 6-114 metadata 字段数据结构说明

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only.

参数	参数类型	描述
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.

表 6-115 ReplicationControllerCondition 字段数据结构说明

参数	参数类型	描述
lastTransitionTime	String	The last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of replication controller condition.

表 6-116 status v1 Core 字段数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
code	Integer	Suggested HTTP return code for this status, 0 if not set
details	StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase
message	String	A human-readable description of the status of this operation

参数	参数类型	描述
metadata	ListMeta v1 meta object	Standard list metadata.
reason	reason object	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure".

表 6-117 StatusDetails v1 meta 数据结构说明

参数	参数类型	描述
causes	Array of StatusCause object	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action - for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described)

表 6-118 StatusCause v1 meta 数据结构说明

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	StatusCause Type object	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 6-119 StatusCause reason 字段值范围说明

值	描述
FieldValueNotFound	CauseTypeFieldValueNotFound is used to report failure to find a requested value.(e.g. looking up an ID)
FieldValueRequired	CauseTypeFieldValueRequired is used to report required values that are not provided (e.g. empty strings, null values, or empty arrays).
FieldValueDuplicate	CauseTypeFieldValueDuplicate is used to report collisions of values that must be unique (e.g. unique IDs).
FieldValueInvalid	CauseTypeFieldValueInvalid is used to report malformed values (e.g. failed regex match).
FieldValueNotSupported	CauseTypeFieldValueNotSupported is used to report valid (as per formatting rules) values that cannot be handled (e.g. an enumerated string).
UnexpectedServerResponse	CauseTypeUnexpectedServerResponse is used to report when the server responded to the client without the expected return type. The presence of this cause indicates the error may be due to an intervening proxy or the server software malfunctioning.

表 6-120 ListMeta v1 meta 数据结构说明

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only

表 6-121 Status v1 中 reason 值说明

名称	值	描述
StatusReasonUnknown	“ ”	StatusReasonUnknown means the server has declined to indicate a specific reason. The details field may contain other information about this error. Status code 500
StatusReasonUnauthorized	Unauthorized	StatusReasonUnauthorized means the server can be reached and understood the request, but requires the user to present appropriate authorization credentials (identified by the WWW-Authenticate header) in order for the action to be completed. If the user has specified credentials on the request, the server considers them insufficient. Status code 401

名称	值	描述
StatusReasonForbidden	Forbidden	StatusReasonForbidden means the server can be reached and understood the request, but refuses to take any further action. It is the result of the server being configured to deny access for some reason to the requested resource by the client. Details (optional): "kind" string - the kind attribute of the forbidden resource on some operations may differ from the requested resource. "id" string - the identifier of the forbidden resource Status code 403
StatusReasonNotFound	NotFound	StatusReasonNotFound means one or more resources required for this operation could not be found. Details (optional): "kind" string - the kind attribute of the missing resource on some operations may differ from the requested resource. "id" string - the identifier of the missing resource Status code 404
StatusReasonAlreadyExists	AlreadyExists	StatusReasonAlreadyExists means the resource you are creating already exists. Details (optional): "kind" string - the kind attribute of the conflicting resource "id" string - the identifier of the conflicting resource Status code 409
StatusReasonConflict	Conflict	StatusReasonConflict means the requested operation cannot be completed due to a conflict in the operation. The client may need to alter the request. Each resource may define custom details that indicate the nature of the conflict. Status code 409
StatusReasonGone	Gone	StatusReasonGone means the item is no longer available at the server and no forwarding address is known. Status code 410

名称	值	描述
StatusReasonInvalid	Invalid	<p>StatusReasonInvalid means the requested create or update operation cannot be completed due to invalid data provided as part of the request. The client may need to alter the request. When set, the client may use the StatusDetailsmessage field as a summary of the issues encountered.</p> <p>Details (optional):</p> <p>"kind" string - the kind attribute of the invalid resource</p> <p>"id" string - the identifier of the invalid resource</p> <p>"causes" - one or more StatusCause entries indicating the data in the provided resource that was invalid. The code, message, and field attributes will be set.</p> <p>Status code 422</p>
StatusReasonServerTimeout	ServerTimeout	<p>StatusReasonServerTimeout means the server can be reached and understood the request, but cannot complete the action in a reasonable time. The client should retry the request. This is probably due to temporary server load or a transient communication issue with another server. Status code 500 is used because the HTTP spec provides no suitable server-requested client retry and the 5xx class represents actionable errors.</p> <p>Details (optional):</p> <p>"kind" string - the kind attribute of the resource being acted on.</p> <p>"id" string - the operation that is being attempted.</p> <p>"retryAfterSeconds" int32 - the number of seconds before the operation should be retried</p> <p>Status code 500</p>
StatusReasonTimeout	Timeout	<p>StatusReasonTimeout means that the request could not be completed within the given time. Clients can get this response only when they specified a timeout param in the request, or if the server cannot complete the operation within a reasonable amount of time. The request might succeed with an increased value of timeout param. The client <i>should</i> wait at least the number of seconds specified by the retryAfterSeconds field. Details (optional): "retryAfterSeconds" int32 - the number of seconds before the operation should be retried</p> <p>Status code 504</p>

名称	值	描述
StatusReasonBadRequest	BadRequest	StatusReasonBadRequest means that the request itself was invalid, because the request does not make any sense, for example deleting a read-only object. This is different from StatusReasonInvalid above which indicates that the API call could possibly succeed, but the data was invalid. API calls that return BadRequest can never succeed.
StatusReasonMethodNotAllowed	MethodNotAllowed	StatusReasonMethodNotAllowed means that the action the client attempted to perform on the resource was not supported by the code - for instance, attempting to delete a resource that can only be created. API calls that return MethodNotAllowed can never succeed.
StatusReasonInternalError	InternalError	StatusReasonInternalError indicates that an internal error occurred, it is unexpected and the outcome of the call is unknown. Details (optional): "causes" - The original error Status code 500
StatusReasonExpired	Expired	StatusReasonExpired indicates that the request is invalid because the content you are requesting has expired and is no longer available. It is typically associated with watches that cannot be serviced. Status code 410 (gone)
StatusReasonServiceUnavailable	ServiceUnavailable	StatusReasonServiceUnavailable means that the request itself was valid, but the requested service is unavailable at this time. Retrying the request after some time might succeed. Status code 503

6.3 数据结构

表 6-122 PodTemplate 数据结构说明

参数	是否必选	参数类型	描述
kind	Yes	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is PodTemplate .
apiVersion	Yes	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
metadata	Yes	ObjectMeta object	-
template	Yes	PodTemplate Spec object	-

表 6-123 Pod 数据结构说明

参数	是否必选	参数类型	描述
kind	Yes	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is Pod .

参数	是否必选	参数类型	描述
apiVersion	Yes	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
metadata	Yes	ObjectMeta object	-
spec	Yes	podSpec object	-
status	No	PodStatus object	Most recently observed status of the pod.

表 6-124 PodStatus 字段数据结构说明

参数	是否必选	参数类型	描述
phase	No	String	Current condition of the pod. 说明 Pod的状态有： - Pending: means the pod has been accepted by the system, but one or more of the containers has not been started. This includes time before being bound to a node, as well as time spent pulling images onto the host. - Running: the pod has been bound to a node and all of the containers have been started. At least one container is still running or is in the process of being restarted. - Succeeded: all containers in the pod have voluntarily terminated with a container exit code of 0, and the system is not going to restart any of these containers. - Failed: all containers in the pod have terminated, and at least one container has terminated in a failure (exited with a non-zero exit code or was stopped by the system). - Unknown: for some reason the state of the pod could not be obtained, typically due to an error in communicating with the host of the pod.
conditions	No	Array of PodConditions objects	Current service state of the pod.
message	No	String	A human readable message indicating details about why the pod is in this condition.
reason	No	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'OutOfDisk'
hostIP	No	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.

参数	是否必选	参数类型	描述
podIP	No	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
startTime	No	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.
containerStatuses	No	Array of containerStatuses objects	The list has one entry per container in the manifest. Each entry is currently the output of container inspect.
initContainerStatuses	No	Array of containerStatuses objects	The list has one entry per init container in the manifest. The most recent successful init container will have ready = true, the most recently started container will have startTime set.
qosClass	No	String	The Quality of Service (QOS) classification assigned to the pod based on resource requirements. Can be <ul style="list-style-type: none">- Guaranteed- Burstable- BestEffort
podNetworks	No	Array of PodNetworkInterface objects	Complete list of Networks attached to this pod

表 6-125 PodConditions 字段数据结构说明

参数	是否必选	参数类型	描述
type	No	String	Type of the condition. Currently only Ready. Resizing - An user trigger resize of pvc has been started 说明 PodCondition的状态有： - PodScheduled: represents status of the scheduling process for this pod. - Ready: pod is able to service requests and should be added to the load balancing pools of all matching services. - Initialized: all init containers in the pod have started successfully. - Unscheduleable: the scheduler cannot schedule the pod right now, for example due to insufficient resources in the cluster.
status	No	String	Status of the condition. Can be True, False, or Unknown.
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
reason	No	String	Unique, one-word, CamelCase reason for the condition's last transition.
message	No	String	Human-readable message indicating details about last transition.

表 6-126 containerStatuses 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	This must be a DNS_LABEL. Each container in a pod must have a unique name. Cannot be updated.

参数	是否必选	参数类型	描述
state	No	ContainerState object	Details about the container's current condition.
lastState	No	ContainerState object	Details about the container's last termination condition.
ready	No	Boolean	Specifies whether the container has passed its readiness probe.
restartCount	No	Integer	The number of times the container has been restarted, currently based on the number of dead containers that have not yet been removed. Note that this is calculated from dead containers. However, those containers are subject to garbage collection. This value will get capped at 5 by GC.
image	Yes	String	The image the container is running.
imageID	No	String	ID of the container's image.
containerID	No	String	Container's ID in the format 'docker://'.

表 6-127 ContainerState 字段数据结构说明

参数	是否必选	参数类型	描述
waiting	No	ContainerStateWaiting object	Details about a waiting container
running	No	ContainerStateRunning object	Details about a running container
terminated	No	terminated object	Details about a terminated container

表 6-128 ContainerStateWaiting 字段数据结构说明

参数	是否必选	参数类型	描述
reason	No	String	(Brief) Reason the container is not yet running.
message	No	String	Message regarding why the container is not yet running.

表 6-129 ContainerStateRunning 字段数据结构说明

参数	是否必选	参数类型	描述
startedAt	No	String	Time at which the container was last (re-)started.

表 6-130 terminated 字段数据结构说明

参数	是否必选	参数类型	描述
exitCode	No	Integer	Exit status from the last termination of the container.
signal	No	Integer	Signal from the last termination of the container.
reason	No	String	(Brief) reason from the last termination of the container.
message	No	String	Message regarding the last termination of the container.
startedAt	No	String	Time at which previous execution of the container started.
finishedAt	No	String	Time at which the container last terminated.
containerID	No	String	Container's ID in the format 'docker://'

表 6-131 ObjectMeta 字段数据结构说明

参数	是否 必选	参数类型	描述
name	Yes	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. 0 characters < name length ≤ 63 characters. The name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.
cluster Name	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
initializers	No	initializer s object	An initializer is a controller which enforces some system invariant at object creation time. This field is a list of initializers that have not yet acted on this object. If nil or empty, this object has been completely initialized. Otherwise, the object is considered uninitialized and is hidden (in list/watch and get calls) from clients that haven't explicitly asked to observe uninitialized objects. When an object is created, the system will populate this list with the current set of initializers. Only privileged users may set or modify this list. Once it is empty, it may not be modified further by any user.
enable	No	Boolean	Enable identify whether the resource is available.

参数	是否必选	参数类型	描述
generateName	No	String	<p>An optional prefix used by the server to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different from the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409. Instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified.</p> <p>0 characters < generated name length ≤ 253 characters.</p> <p>The generated name must be a regular expression <code>[a-z0-9]([-a-z0-9]*[a-z0-9])?</code>.</p>
namespace	No	String	<p>Namespace defines the space within each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated.</p> <p>0 characters < namespace length ≤ 63 characters.</p> <p>The namespace must be a regular expression <code>[a-z0-9]([-a-z0-9]*[a-z0-9])?</code>.</p>
selfLink	No	String	<p>A URL representing this object. Populated by the system. Read-only.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>

参数	是否必选	参数类型	描述
resourceVersion	No	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>
generation	No	Integer	<p>A sequence number representing a specific generation of the desired state. Currently only implemented by replication controllers. Populated by the system. Read-only.</p>
creationTimestamp	No	String	<p>A timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>
deletionTimestamp	No	String	<p>RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource will be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field. Once set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. Once the resource is deleted in the API, the Kubelet will send a hard termination signal to the container. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only.</p>

参数	是否必选	参数类型	描述
deletionGracePeriodSeconds	No	Integer	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
labels	No	Object	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services.
annotations	No	annotations object	An unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. 说明 不同的资源类型必填的annotation不同，详见具体的资源API。
ownerReferences	No	Array of ownerReferences objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
finalizers	No	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed.

表 6-132 annotations 字段数据结构说明

参数	是否必选	参数类型	描述
pod.logcollection.kubernetes.io	No	Array of strings	<p>用于配置需要采集标准输出日志的容器列表。若不配置表示收集所有容器列表。</p> <ul style="list-style-type: none"> 示例1：收集所有 containers。 pod annotation: log.stdoutcollection.kubernetes.io: {"collectionContainers":[]} 示例2：采集容器 container0，其中container0为容器名。 pod annotation: log.stdoutcollection.kubernetes.io: {"collectionContainers": ["container0"]}
paas.storage.io/cryptKeyId	No	String	<p>加密密钥ID。 存储类型为SFS或EVS且需创建加密卷时，才需配置该参数。 密钥ID可从“安全控制台 > 数据加密服务 > 密钥管理”页面获取。</p>
paas.storage.io/cryptAlias	No	String	<p>加密密钥别名。 存储类型为SFS且需创建加密卷时，才需配置该参数。 密钥名称可从“安全控制台 > 数据加密服务 > 密钥管理”页面获取。</p>
paas.storage.io/cryptDomainId	No	String	<p>租户的DomainId 存储类型为SFS且需创建加密卷时，才需配置该参数。</p>

表 6-133 initializers 字段数据结构说明

参数	是否必选	参数类型	描述
pending	No	Array of pending objects	<p>Pending is a list of initializers that must execute in order before this object is visible. When the last pending initializer is removed, and no failing result is set, the initializers struct will be set to nil and the object is considered as initialized and visible to all clients.</p>

参数	是否必选	参数类型	描述
result	No	status object	If result is set with the Failure field, the object will be persisted to storage and then deleted, ensuring that other clients can observe the deletion.

表 6-134 pending 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	name of the process that is responsible for initializing this object.

表 6-135 ownerReferences 字段数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Default to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
kind	Yes	String	Kind of the referent.
name	Yes	String	Name of the referent.
uid	No	String	UID of the referent.
controller	No	Boolean	If true, this reference points to the managing controller.

表 6-136 spec 字段数据结构说明

参数	是否必选	参数类型	描述
replicas	No	Integer	The number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Value range: ≥ 0 . Default: 1
minReadySeconds	No	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its containers crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
template	Yes	PodTemplate Spec object	-
selector	Yes	Object	A label query over pods that should match the Replicas count. If Selector is empty, it is defaulted to the labels present on the Pod template. Label keys and values that must match in order to be controlled by this replication controller, if empty defaulted to labels on Pod template.

表 6-137 status 字段数据结构说明

参数	是否必选	参数类型	描述
replicas	No	Integer	The most recently observed number of replicas.
availableReplicas	No	Integer	The number of available replicas (ready for at least minReadySeconds) for this replication controller.
readyReplicas	No	Integer	The number of ready replicas for this replication controller.
conditions	No	condition object	Represents the latest available observations of a replication controller's current state.

参数	是否必选	参数类型	描述
observedGeneration	No	Integer	Reflects the generation of the most recently observed replication controller.
FullylabeledReplicas	No	Object	-

表 6-138 PodTemplateSpec 字段数据结构说明

参数	是否必选	参数类型	描述
metadata	No	ObjectMeta object	-
spec	Yes	podSpec object	-

表 6-139 condition 字段数据结构说明

参数	是否必选	参数类型	描述
lastTransitionTime	No	String	The last time the condition transitioned from one status to another.
message	No	String	A human readable message indicating details about the transition.
reason	No	String	The reason for the condition's last transition.
status	No	String	Status of the condition, one of True, False, Unknown.
type	No	String	Type of replication controller condition.

表 6-140 podSpec 字段数据结构说明

参数	是否必选	参数类型	描述
volumes	No	Array of volumes objects	List of volumes that can be mounted by containers belonging to the pod.

参数	是否必选	参数类型	描述
affinity	No	affinity object	If specified, the pod's scheduling constraints. 说明 不允许用户设置affinity，默认使用软反亲和
containers	Yes	Array of containers objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a pod. Cannot be updated.
restartPolicy	No	String	Restart policy for all containers within the pod. Value: <ul style="list-style-type: none">• Always• OnFailure• Never Default: Always.
priority	No	Integer	Pod优先级，数值越大优先级越高，默认值为0。 取值范围：[-10, 10]
terminationGracePeriodSeconds	No	Integer	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be a non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.

参数	是否必选	参数类型	描述
activeDeadlineSeconds	No	Integer	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer. Value range of this parameter: > 0.
dnsPolicy	No	String	Set DNS policy for containers within the pod. Value: <ul style="list-style-type: none"> ClusterFirst Default 说明 dnsPolicy不支持设置为Default Default: ClusterFirst.
hostAliases	No	Array of hostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
serviceAccountName	No	String	Name of the ServiceAccount used to run this pod. 0 characters < service account name length ≤ 253 characters. The service account name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?. 说明 不支持serviceaccount,该字段不支持设置
serviceAccount	No	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead. 说明 不支持serviceaccount,该字段不支持设置

参数	是否必选	参数类型	描述
schedulerName	No	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler. 说明 不支持设置指定scheduler name
nodeName	No	String	A request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements. 0 characters < node name length ≤ 253 characters. The node name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?. 说明 不支持设置nodeName
nodeSelector	No	Object	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. 说明 不支持设置nodeSelector
automountServiceAccountToken	No	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
hostNetwork	No	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false. (不支持设置) 说明 不支持使用主机网络

参数	是否必选	参数类型	描述
hostPID	No	Boolean	A flag indicating whether to use the host's pid namespace. Optional: Default to false. 说明 不支持使用主机PID namespaces
hostIPC	No	Boolean	A flag indicating whether to use the host's ipc namespace. Optional: Default to false. 说明 不支持使用主机IPC namespaces
securityContext	No	PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Defaults to empty.
imagePullSecrets	No	Array of imagePullSecrets objects	An optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. 说明 使用的镜像是容器镜像服务界面上的“我的镜像”页签中的镜像时必须设置。

参数	是否必选	参数类型	描述
initContainers	No	Array of containers objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, or Liveness probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed.
hostname	No	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
subdomain	No	String	If specified, the fully qualified Pod hostname will be "<hostname>.<subdomain>.<pod namespace>.svc<cluster domain>". If not specified, the pod will not have a domainname at all.
tolerations	No	tolerations object	If specified, the pod's tolerations. 说明 不支持设置tolerations

参数	是否必选	参数类型	描述
priorityClassName	No	String	If specified, indicates the pod's priority. "SYSTEM" is a special keyword which indicates the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.

表 6-141 volumes 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Volume name. Must be a DNS_LABEL and unique within the pod. 0 characters < volume name length ≤ 63 characters. The volume name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.
secret	No	SecretVolumeSource object	Secret represents a secret that should populate this volume.
persistentVolumeClaim	No	PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace.
localDir	No	LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
emptyDir	No	emptyDir object	通过LVM方式创建本地卷的Pod实例。

表 6-142 containers 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated. 0 characters < container name length ≤ 63 characters. The container name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?. Cannot be updated.
image	Yes	String	容器镜像地址，具体请参见 获取容器镜像地址 。
command	No	Array of strings	Entrypoint array. Not executed within a shell. The container image's entrypoint is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, for example, \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated.
args	No	Array of strings	Arguments to the entrypoint. The container image's cmd is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, for example, \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated.
workingDir	No	String	Container's working directory. Defaults to Container's default. Defaults to image's default. Cannot be updated.
ports	No	Array of ContainerPort objects	List of ports to expose from the container. Cannot be updated.

参数	是否必选	参数类型	描述
env	No	Array of EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	No	Array of EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
resources	No	ResourceRequirements object	Minimum resources the volume should have. Cannot be updated.
volumeMounts	No	Array of volumeMounts objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
volumeDevices	No	Array of volumeDevice objects	volumeDevices is the list of block devices to be used by the container. This is an alpha feature and may change in the future.
livenessProbe	No	Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated.
readinessProbe	No	Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated.
lifecycle	No	lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.

参数	是否必选	参数类型	描述
terminationMessagePath	No	String	Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Defaults to /dev/termination-log. Cannot be updated. Cannot be updated.
terminationMessagePolicy	No	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated. 说明 支持的值： - File: default behavior and will set the container status message to the contents of the container's terminationMessagePath when the container exits. - FallbackToLogsOnError: will read the most recent contents of the container logs for the container status message when the container exits with an error and the terminationMessagePath has no contents.
imagePullPolicy	No	String	Image pull policy. Defaults to Always if the :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. Value: <ul style="list-style-type: none"> • Always • Never • IfNotPresent Cannot be updated. 说明 只支持 Always
securityContext	No	security Context object	Security options the pod should run with

参数	是否必选	参数类型	描述
stdin	No	Boolean	A flag indicating whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	No	Boolean	A flag indicating whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true, the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container process that reads from stdin will never receive an EOF. Default is false.
tty	No	Boolean	A flag indicating whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

表 6-143 PodSecurityContext 字段数据结构说明

参数	是否必选	参数类型	描述
seLinuxOptions	No	seLinuxOptions object	-
runAsUser	No	Integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Value length: > 0 characters.

参数	是否必选	参数类型	描述
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
supplementalGroups	No	Array of integers	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
fsGroup	No	Integer	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw.

参数	是否必选	参数类型	描述
fsOwner	No	Integer	A special supplemental owner that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod: <ol style="list-style-type: none">1. The owning UID will be the FSOwner2. The setgid bit is set (new files created in the volume will be owned by FSOwner)3. The permission bits are OR'd with rw----- If unset, the Kubelet will not modify the ownership and permissions of any volume.

表 6-144 imagePullSecrets 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	Name of the referent. 须知 创建工作负载时，使用的镜像是容器镜像服务界面上的“我的镜像”页签中的镜像，那么该参数的值必须设置为“imagepull-secret”。

表 6-145 SecretVolumeSource 字段数据结构说明

参数	是否必选	参数类型	描述
secretName	No	String	Name of a secret in the pod's namespace.

参数	是否必选	参数类型	描述
items	No	items(KeyToPath) object	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error. Paths must be relative and may not contain the '..' path or start with '..'.
defaultMode	否	Integer	Optional: mode bits to use on created files by default. Must be a value between 0 and 0777. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
optional	否	Boolean	Specify whether the Secret or its keys must be defined

表 6-146 PersistentVolumeClaimVolumeSource 字段数据结构说明

参数	是否必选	参数类型	描述
claimName	No	String	Name of a PersistentVolumeClaim in the same namespace as the pod using this volume.
readOnly	No	Boolean	readOnly here will force the ReadOnly setting in VolumeMounts. Value: <ul style="list-style-type: none">• true• false Default: false.

表 6-147 items(KeyToPath)字段数据结构说明

参数	是否必选	参数类型	描述
key	No	String	The key to project.
path	No	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '!'. May not start with the string '!'.
mode	No	Integer	mode bits to use on this file, must be a value between 0 and 0777. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

表 6-148 ContainerPort 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services. 0 characters < name length ≤ 15 characters. The name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.
hostPort	No	Integer	Number of the port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this. Value range: [1, 65535]. 说明 不支持配置hostPort

参数	是否必选	参数类型	描述
containerPort	No	Integer	Number of the port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$. Value range: [1, 65535].
protocol	No	String	Protocol for port. Value: <ul style="list-style-type: none">• TCP• UDP Default: TCP.
hostIP	No	String	What host IP to bind the external port to. 说明 不支持配置hostIP

表 6-149 EnvVar 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	No	String	Variable references \$ (VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, for example, \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	No	EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 6-150 ResourceRequirements 字段数据结构说明

参数	是否必选	参数类型	描述
limits	No	Array of ResourceName objects	Maximum amount of compute resources allowed. 说明 limits和requests值必须相等，否则会报错
requests	No	Array of ResourceName objects	Minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. 云容器实例中Pod规格有限制，具体的限制请参见 约束限制 页面的“Pod规格”部分。

表 6-151 ResourceName 字段可选值说明

参数	是否必选	参数类型	描述
storage	No	String	Volume size, in bytes (e.g. 5Gi = 5GiB = 5 * 1024 * 1024 * 1024)
cpu	No	String	CPU size, in cores. (500m = .5 cores)
memory	No	String	Memory size, in bytes. (500Gi = 500GiB = 500 * 1024 * 1024 * 1024)
localdir	No	String	Local Storage for LocalDir, in bytes. (500Gi = 500GiB = 500 * 1024 * 1024 * 1024)
nvidia.com/gpu-tesla-v100-16GB	No	String	NVIDIA GPU resource, the type may change in different environments, in production environment is nvidia.com/gpu-tesla-v100-16GB now. The value must be an integer and not less than 1.

表 6-152 volumeMounts 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	This must match the Name of a Volume. 0 character < name length ≤ 253 characters. The name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.
readOnly	No	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Value: <ul style="list-style-type: none">• true• false Default: false.
mountPath	No	String	Path within the container at which the volume should be mounted. Value length: > 0 characters.
subPath	No	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).

参数	是否必选	参数类型	描述
mountPropagation	No	String	<p>mountPropagation determines how mounts are propagated from the host to container and the other way around.</p> <p>When not set, MountPropagationHostToContainer is used。 This field is alpha in 1.8 and can be reworked or removed in a future release.</p> <p>说明 可设置的值有：</p> <ul style="list-style-type: none">- HostToContainer: means that the volume in a container will receive new mounts from the host or other containers, but filesystems mounted inside the container will not be propagated to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rslave" in Linux terminology).- Bidirectional: means that the volume in a container will receive new mounts from the host or other containers, and its own mounts will be propagated from the container to the host or other containers. Note that this mode is recursively applied to all mounts in the volume ("rshared" in Linux terminology)

参数	是否必选	参数类型	描述
extendPathMode	No	String	Extend the volume path by appending the pod metadata to the path according to specified pattern, which provides a way of directory isolation and helps prevent the writing conflict between different pods. 说明 可设置的值有： - PodUID: Include PodUID in path - PodName: Include Pod full name in path - PodUID/ContainerName: Include Pod UID and container name in path - PodName/ContainerName: Include Pod full name and container name in path

表 6-153 volumeDevice 数据结构说明

参数	参数类型	描述
name	String	name must match the name of a persistentVolumeClaim in the pod
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.

表 6-154 Probe 字段数据结构说明

参数	是否必选	参数类型	描述
exec	No	exec object	Only one option should be specified. Exec specifies the action to take.
initialDelaySeconds	No	Integer	Number of seconds after the container has started before liveness probes are initiated. Value range: ≥ 0 .

参数	是否必选	参数类型	描述
timeoutSeconds	No	Integer	Number of seconds after which the probe times out. Value range: ≥ 0 . Default: 1.
periodSeconds	No	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1. Value range: ≥ 0 . Default: 10.
successThreshold	No	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness. Minimum value is 1. Value range: ≥ 0 . Default: 1.
failureThreshold	No	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1. Value range: ≥ 0 . Default: 3.

表 6-155 lifecycle 字段数据结构说明

参数	是否必选	参数类型	描述
postStart	No	Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes.

参数	是否必选	参数类型	描述
preStop	No	Handler object	<p>PreStop is called immediately before a container is terminated. The container is terminated after the handler completes. The reason for termination is passed to the handler.</p> <p>Regardless of the outcome of the handler, the container is eventually terminated.</p> <p>Other management of the container blocks until the hook completes.</p>

表 6-156 securityContext 字段数据结构说明

参数	是否必选	参数类型	描述
capabilities	No	capabilities object	<p>The capabilities to add/drop when running containers.</p> <p>Defaults to the default set of capabilities granted by the container runtime.</p>
privileged	No	Boolean	<p>Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host.</p> <p>Value:</p> <ul style="list-style-type: none"> • true • false <p>Default: false.</p> <p>说明 不允许设置为True</p>

参数	是否必选	参数类型	描述
seLinuxOptions	No	seLinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	No	Integer	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Value: <ul style="list-style-type: none">• true• false
readOnlyRootFilesystem	No	Boolean	Whether this container has a read-only root filesystem. Default is false.

参数	是否必选	参数类型	描述
allowPrivilegeEscalation	No	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN

表 6-157 seLinuxOptions 字段数据结构说明

参数	是否必选	参数类型	描述
user	No	String	SELinux user label that applies to the container.
role	No	String	SELinux role label that applies to the container.
type	No	String	SELinux type label that applies to the container.
level	No	String	SELinux level label that applies to the container.

表 6-158 items 字段数据结构说明

参数	是否必选	参数类型	描述
path	No	String	Relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
fieldRef	No	ObjectFieldSelector object	-

参数	是否必选	参数类型	描述
resourceFieldRef	No	ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests. (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 6-159 EnvVarSource 字段数据结构说明

参数	是否必选	参数类型	描述
fieldRef	No	ObjectFieldSelector object	Selects a field of the pod: supports metadata.name, metadata.namespace, metadata.labels, metadata.annotations, spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP.
resourceFieldRef	No	ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests. (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.
configMapKeyRef	No	ConfigMapKeySelector object	Selects a key of a ConfigMap.
secretKeyRef	No	SecretKeySelector object	Selects a key of a secret in the pod's namespace
processResourceFieldRef	No	ProcessResourceFieldSelector object	Selects a resource of the process: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 6-160 exec 字段数据结构说明

参数	是否必选	参数类型	描述
command	No	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply executed, it is not run inside a shell, so traditional shell instructions (' ', etc) do not work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 6-161 Handler 数据结构说明

参数	是否必选	参数类型	描述
exec	No	exec object	Only one option should be specified. Exec specifies the action to take.

表 6-162 capabilities 字段数据结构说明

参数	是否必选	参数类型	描述
add	No	Array of strings	Added capabilities.
drop	No	Array of strings	Removed capabilities.

表 6-163 ObjectFieldSelector 字段数据结构说明

参数	是否必选	参数类型	描述
apiVersion	No	String	Version of the schema the FieldPath is written in terms of. Defaults to "v1".
fieldPath	No	String	Path of the field to select in the specified API version.

表 6-164 ResourceFieldSelector 字段数据结构说明

参数	是否必选	参数类型	描述
containerName	No	String	Container name: required for volumes, optional for env vars.
resource	Yes	String	Required: resource to select.
divisor	No	String	Specifies the output format of the exposed resources, defaults to "1".

表 6-165 ConfigMapKeySelector 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	The ConfigMap name to select from
key	No	String	The key to select
optional	No	String	Specify whether the ConfigMap or its key must be defined

表 6-166 SecretKeySelector 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	The secret name to select from
key	No	String	The key to select
optional	No	String	Specify whether the Secret or its key must be defined

表 6-167 ProcessResourceFieldSelector 字段数据结构说明

参数	是否必选	参数类型	描述
processName	No	String	Process name: required for volumes, optional for env vars
resource	Yes	String	Required: resource to select.
divisor	No	Integer	Specifies the output format of the exposed resources, defaults to "1".

表 6-168 EnvFromSource 字段数据结构说明

参数	是否必选	参数类型	描述
prefix	No	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
configMapRef	No	ConfigMapEnvSource object	The ConfigMap to select from
secretRef	No	SecretEnvSource object	The Secret to select from

表 6-169 ConfigMapEnvSource 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	The ConfigMap to select from
optional	No	String	Specify whether the ConfigMap must be defined

表 6-170 SecretEnvSource 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	The Secret name to select from
optional	No	String	Specify whether the Secret must be defined

表 6-171 add 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name of the resource.
namespaced	No	Boolean	A flag indicating whether a resource is namespaced or not. Default: false.
kind	No	String	kind of the resource.

表 6-172 affinity 字段数据结构说明

参数	是否必选	参数类型	描述
nodeAffinity	No	nodeAffinity object	Describes node affinity scheduling rules for the pod.
podAffinity	No	podAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	No	podAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 6-173 nodeAffinity 字段数据结构说明

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	No	preferredDuringSchedulingIgnoredDuringExecution object	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	是否必选	参数类型	描述
<code>requiredDuringSchedulingIgnoredDuringExecution</code>	No	<code>requiredDuringSchedulingIgnoredDuringExecution</code> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 6-174 podAffinity 字段数据结构说明

参数	是否必选	参数类型	描述
<code>preferredDuringSchedulingIgnoredDuringExecution</code>	No	<code>preferredDuringSchedulingIgnoredDuringExecution</code> object	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, <code>requiredDuringScheduling</code> affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which match the corresponding <code>podAffinityTerm</code> ; the node(s) with the highest sum are the most preferred.

参数	是否必选	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	No	podAffinityTerm object	<p>NOT YET IMPLEMENTED. TODO: Uncomment field once it is implemented. If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system will try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.</p> <p>RequiredDuringSchedulingRequiredDuringExecution []PodAffinityTerm json:"requiredDuringSchedulingRequiredDuringExecution,omitempty" If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.</p>

表 6-175 preferredDuringSchedulingIgnoredDuringExecution 字段数据结构说明

参数	是否必选	参数类型	描述
preference	No	preference object	A node selector term, associated with the corresponding weight.
weight	No	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 6-176 requiredDuringSchedulingIgnoredDuringExecution 字段数据结构说明

参数	是否必选	参数类型	描述
nodeSelectorTerms	No	preference object	Required. A list of node selector terms. The terms are ORed.

表 6-177 preference 字段数据结构说明

参数	是否必选	参数类型	描述
matchExpressions	No	matchExpressions object	Required. A list of node selector requirements. The requirements are ANDed.

表 6-178 matchExpressions 字段数据结构说明

参数	是否必选	参数类型	描述
key	No	String	The label key that the selector applies to.
operator	No	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

参数	是否必选	参数类型	描述
values	No	String	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 6-179 preferredDuringSchedulingIgnoredDuringExecution 字段数据结构说明

参数	是否必选	参数类型	描述
podAffinityTerm	No	podAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	No	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 6-180 podAffinityTerm 字段数据结构说明

参数	是否必选	参数类型	描述
labelSelector	No	labelSelector object	A label query over a set of resources, in this case pods.
namespaces	No	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"

参数	是否必选	参数类型	描述
topologyKey	No	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. For PreferredDuringScheduling pod anti-affinity, empty topologyKey is interpreted as "all topologies" ("all topologies" here means all the topologyKeys indicated by scheduler command-line argument --failure-domains); for affinity and for RequiredDuringScheduling pod anti-affinity, empty topologyKey is not allowed.

表 6-181 labelSelector 字段数据结构说明

参数	是否必选	参数类型	描述
matchExpressions	No	Array of LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Object	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 6-182 LabelSelectorRequirement 字段数据结构说明

参数	是否必选	参数类型	描述
key	No	String	key is the label key that the selector applies to.
operator	No	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 6-183 hostAliases 字段数据结构说明

参数	是否必选	参数类型	描述
hostnames	No	Array of strings	Hostnames for the above IP address.
ip	No	String	IP address of the host file entry.

表 6-184 tolerations 字段数据结构说明

参数	是否必选	参数类型	描述
effect	No	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	No	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.

参数	是否必选	参数类型	描述
operator	No	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	No	Integer	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	No	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 6-185 DeleteOptions 数据结构说明

参数	是否必选	参数类型	描述
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is Namespace .

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be a non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately. Value range of this parameter: > 0.
preconditions	No	preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
orphanDependents	No	Boolean	Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list.

参数	是否必选	参数类型	描述
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. 须知 Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 6-186 preconditions 字段数据结构说明

参数	是否必选	参数类型	描述
uid	No	String	Specifies the target UID.

表 6-187 PodNetworkInterface 数据结构说明

参数	参数类型	描述
name	String	Name of the interface inside the pod
network	String	Name of the attached network
ip	Array of strings	IP address(both v4 and v6) of this interface

表 6-188 v1.PodList 数据结构参数说明

参数	参数类型	描述
kind	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadataString	ListMeta object	-
items	Array of Pod objects	List of pods.

表 6-189 v1.PodTemplateList 数据结构参数说明

参数	参数类型	描述
kind	String	A string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	Versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	ListMeta object	-
items	Array of PodTemplate objects	List of pod templates.

表 6-190 status 字段数据结构说明

参数	参数类型	描述
phase	String	Current condition of the pod.
conditions	PodConditions object	Current service state of the pod.

参数	参数类型	描述
message	String	A human readable message indicating details about why the pod is in this condition.
reason	String	A brief CamelCase message indicating details about why the pod is in this state. e.g. 'OutOfDisk'
hostIP	String	IP address of the host to which the pod is assigned. Empty if not yet scheduled.
podIP	String	IP address allocated to the pod. Routable at least within the cluster. Empty if not yet allocated.
startTime	String	RFC 3339 date and time at which the object was acknowledged by the Kubelet. This is before the Kubelet pulled the container image(s) for the pod.
containerStatuses	containerStatuses object	The list has one entry per container in the manifest. Each entry is currently the output of container inspect.

表 6-191 metadata 字段数据结构说明

参数	参数类型	描述
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only.

表 6-192 objectReference 字段数据结构说明

参数	参数类型	描述
kind	String	Kind of the referent.
namespace	String	Namespace of the referent.
name	String	Name of the referent.
uid	String	UID of the referent.
apiVersion	String	API version of the referent.
resourceVersion	String	Specific resourceVersion to which this reference is made, if any.
fieldPath	String	Path of the field to select in the specified API version.

表 6-193 status 字段数据结构说明

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	ListMeta object	Standard list metadata.
status	String	Status of the operation. One of: "Success" or "Failure".
message	String	A human-readable description of the status of this operation.
reason	reason object	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
details	StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.

参数	参数类型	描述
code	Integer	Suggested HTTP return code for this status, 0 if not set.

表 6-194 StatusDetails 数据结构说明

参数	参数类型	描述
causes	Array of StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action - for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described)

表 6-195 StatusCause 数据结构说明

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.

参数	参数类型	描述
reason	StatusCauseReason object	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 6-196 StatusCause reason 字段值范围说明

参数	描述
FieldValueNotFound	CauseTypeFieldValueNotFound is used to report failure to find a requested value.(e.g. looking up an ID)
FieldValueRequired	CauseTypeFieldValueRequired is used to report required values that are not provided (e.g. empty strings, null values, or empty arrays).
FieldValueDuplicate	CauseTypeFieldValueDuplicate is used to report collisions of values that must be unique (e.g. unique IDs).
FieldValueInvalid	CauseTypeFieldValueInvalid is used to report malformed values (e.g. failed regex match).
FieldValueNotSupported	CauseTypeFieldValueNotSupported is used to report valid (as per formatting rules) values that cannot be handled (e.g. an enumerated string).
UnexpectedServerResponse	CauseTypeUnexpectedServerResponse is used to report when the server responded to the client without the expected return type. The presence of this cause indicates the error may be due to an intervening proxy or the server software malfunctioning.

表 6-197 ListMeta 数据结构说明

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only

表 6-198 reason

名称	值	描述
StatusReasonUnknown	“ ”	StatusReasonUnknown means the server has declined to indicate a specific reason. The details field may contain other information about this error. Status code 500
StatusReasonUnauthorized	Unauthorized	StatusReasonUnauthorized means the server can be reached and understood the request, but requires the user to present appropriate authorization credentials (identified by the WWW-Authenticate header) in order for the action to be completed. If the user has specified credentials on the request, the server considers them insufficient. Status code 401
StatusReasonForbidden	Forbidden	StatusReasonForbidden means the server can be reached and understood the request, but refuses to take any further action. It is the result of the server being configured to deny access for some reason to the requested resource by the client. Details (optional): "kind" string - the kind attribute of the forbidden resource on some operations may differ from the requested resource. "id" string - the identifier of the forbidden resource Status code 403

名称	值	描述
StatusReasonNotFound	NotFound	StatusReasonNotFound means one or more resources required for this operation could not be found. Details (optional): "kind" string - the kind attribute of the missing resource on some operations may differ from the requested resource. "id" string - the identifier of the missing resource Status code 404
StatusReasonAlreadyExists	AlreadyExists	StatusReasonAlreadyExists means the resource you are creating already exists. Details (optional): "kind" string - the kind attribute of the conflicting resource "id" string - the identifier of the conflicting resource Status code 409
StatusReasonConflict	Conflict	StatusReasonConflict means the requested operation cannot be completed due to a conflict in the operation. The client may need to alter the request. Each resource may define custom details that indicate the nature of the conflict. Status code 409
StatusReasonGone	Gone	StatusReasonGone means the item is no longer available at the server and no forwarding address is known. Status code 410
StatusReasonInvalid	Invalid	StatusReasonInvalid means the requested create or update operation cannot be completed due to invalid data provided as part of the request. The client may need to alter the request. When set, the client may use the StatusDetailsmessage field as a summary of the issues encountered. Details (optional): "kind" string - the kind attribute of the invalid resource "id" string - the identifier of the invalid resource "causes" - one or more StatusCause entries indicating the data in the provided resource that was invalid. The code, message, and field attributes will be set. Status code 422

名称	值	描述
StatusReasonServerTimeout	ServerTimeout	<p>StatusReasonServerTimeout means the server can be reached and understood the request, but cannot complete the action in a reasonable time. The client should retry the request. This is probably due to temporary server load or a transient communication issue with another server. Status code 500 is used because the HTTP spec provides no suitable server-requested client retry and the 5xx class represents actionable errors.</p> <p>Details (optional):</p> <p>"kind" string - the kind attribute of the resource being acted on.</p> <p>"id" string - the operation that is being attempted.</p> <p>"retryAfterSeconds" Integer - the number of seconds before the operation should be retried</p> <p>Status code 500</p>
StatusReasonTimeout	Timeout	<p>StatusReasonTimeout means that the request could not be completed within the given time. Clients can get this response only when they specified a timeout param in the request, or if the server cannot complete the operation within a reasonable amount of time. The request might succeed with an increased value of timeout param. The client <i>should</i> wait at least the number of seconds specified by the retryAfterSeconds field. Details (optional): "retryAfterSeconds" int32 - the number of seconds before the operation should be retried</p> <p>Status code 504</p>
StatusReasonTooManyRequests	TooManyRequests	<p>StatusReasonTooManyRequests means the server experienced too many requests within a given window and that the client must wait to perform the action again. A client may always retry the request that led to this error, although the client should wait at least the number of seconds specified by the retryAfterSeconds field.</p> <p>Details (optional):</p> <p>"retryAfterSeconds" int32 - the number of seconds before the operation should be retried</p> <p>Status code 429</p>

名称	值	描述
StatusReasonBadRequest	BadRequest	StatusReasonBadRequest means that the request itself was invalid, because the request does not make any sense, for example deleting a read-only object. This is different from StatusReasonInvalid above which indicates that the API call could possibly succeed, but the data was invalid. API calls that return BadRequest can never succeed.
StatusReasonMethodNotAllowed	MethodNotAllowed	StatusReasonMethodNotAllowed means that the action the client attempted to perform on the resource was not supported by the code - for instance, attempting to delete a resource that can only be created. API calls that return MethodNotAllowed can never succeed.
StatusReasonInternalError	InternalError	StatusReasonInternalError indicates that an internal error occurred, it is unexpected and the outcome of the call is unknown. Details (optional): "causes" - The original error Status code 500
StatusReasonExpired	Expired	StatusReasonExpired indicates that the request is invalid because the content you are requesting has expired and is no longer available. It is typically associated with watches that cannot be serviced. Status code 410 (gone)
StatusReasonServiceUnavailable	ServiceUnavailable	StatusReasonServiceUnavailable means that the request itself was valid, but the requested service is unavailable at this time. Retrying the request after some time might succeed. Status code 503

表 6-199 WatchEvent 数据结构说明

参数	参数类型	描述
type	String	Type of Event. Can be - Added - Modified - Deleted - Error

参数	参数类型	描述
Object	String	Object is: - If Type is Added or Modified: the new state of the object. - If Type is Deleted: the state of the object immediately before deletion. - If Type is Error: Status is recommended; - other types may make sense depending on context.

表 6-200 Deployment 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	Yes	ObjectMeta object	Standard object metadata.
spec	Yes	DeploymentSpec object	Specification of the desired behavior of the Deployment.
status	No	DeploymentStatus object	Most recently observed status of the Deployment.

表 6-201 DeploymentSpec 字段数据结构说明

参数	是否必选	参数类型	描述
minReadySeconds	No	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its containers crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)

参数	是否必选	参数类型	描述
paused	No	Boolean	Indicates that the deployment is paused.
progressDeadlineSeconds	No	Integer	The maximum time in seconds for a deployment to make progress before it is considered to be failed. The deployment controller will continue to process failed deployments and a condition with a ProgressDeadlineExceeded reason will be surfaced in the deployment status. Once autoRollback is implemented, the deployment controller will automatically rollback failed deployments. Note that progress will not be estimated during the time a deployment is paused. Defaults to 600s.
replicas	No	Integer	Number of desired pods. This is a pointer to distinguish between explicit zero and not specified. Defaults to 1. replicas为1表示单个Pod，没有高可用能力，建议设置为多个。
priority	No	Integer	负载优先级，数值越大优先级越高，默认值为0。 取值范围：[-10, 10]
revisionHistoryLimit	No	Integer	The number of old ReplicaSets to retain to allow rollback. This is a pointer to distinguish between explicit zero and not specified. Defaults to 2.
selector	No	labelSelector object	Label selector for pods. Existing ReplicaSets whose pods are selected by this will be the ones affected by this deployment.
strategy	No	DeploymentStrategy object	The deployment strategy to use to replace existing pods with new ones.
template	Yes	PodTemplateSpec object	Template describes the pods that will be created.

表 6-202 DeploymentStatus 字段数据结构说明

参数	是否必选	参数类型	描述
availableReplicas	No	Integer	Total number of available pods (ready for at least minReadySeconds) targeted by this deployment.
collisionCount	No	Integer	Count of hash collisions for the Deployment. The Deployment controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ReplicaSet.
conditions	No	Array of DeploymentCondition objects	Represents the latest available observations of a deployment's current state.
observedGeneration	No	Integer	The generation observed by the deployment controller
readyReplicas	No	Integer	Total number of ready pods targeted by this deployment
replicas	No	Integer	Total number of non-terminated pods targeted by this deployment (their labels match the selector).
unavailableReplicas	No	Integer	Total number of unavailable pods targeted by this deployment.
updatedReplicas	No	Integer	Total number of non-terminated pods targeted by this deployment that have the desired template spec.

表 6-203 DeploymentStrategy 字段数据结构说明

参数	是否必选	参数类型	描述
rollingUpdate	Yes	RollingUpdateDeployment object	Rolling update config params. Present only if DeploymentStrategyType = RollingUpdate.
type	No	String	Type of deployment. Can be "Recreate" or "RollingUpdate". Default is RollingUpdate.

表 6-204 DeploymentCondition 字段数据结构说明

参数	是否必选	参数类型	描述
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
lastUpdateTime	No	String	The last time this condition was updated.
message	No	String	A human readable message indicating details about the transition.
reason	No	String	The reason for the condition's last transition.
status	No	String	Status of the condition, one of True, False, Unknown.
type	No	String	Type of deployment condition. Can be "Available", "Progressing", "ReplicaFailure"

表 6-205 RollingUpdateDeployment 字段数据结构说明

参数	是否必选	参数类型	描述
maxSurge	No	Integer	The maximum number of pods that can be scheduled above the desired number of pods. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). This cannot be 0 if MaxUnavailable is 0. Absolute number is calculated from percentage by rounding up. Defaults to 25%. Example: when this is set to 30%, the new RC can be scaled up immediately when the rolling update starts, such that the total number of old and new pods do not exceed 130% of desired pods. Once old pods have been killed, new RC can be scaled up further, ensuring that total number of pods running at any time during the update is at most 130% of desired pods.

参数	是否必选	参数类型	描述
maxUnavailable	No	Integer	The maximum number of pods that can be unavailable during the update. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). Absolute number is calculated from percentage by rounding down. This cannot be 0 if MaxSurge is 0. Defaults to 25%. Example: when this is set to 30%, the old RC can be scaled down to 70% of desired pods immediately when the rolling update starts. Once new pods are ready, old RC can be scaled down further, followed by scaling up the new RC, ensuring that the total number of pods available at all times during the update is at least 70% of desired pods.

表 6-206 DeploymentList v1 apps 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	No	ListMeta object	Standard object metadata.
items	Yes	Array of Deployment objects	Items is the list of Deployments

表 6-207 StatefulSet 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
metadata	Yes	ObjectMeta object	Standard list metadata.
spec	Yes	StatefulSetSpec object	Spec defines the desired identities of pods in this set.
status	No	StatefulSetStatus object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

表 6-208 StatefulSetStatus 字段数据结构说明

参数	是否必选	参数类型	描述
observedGeneration	No	Integer	Most recent generation observed by this autoscaler.
replicas	No	Integer	Replicas is the number of actual replicas.
currentReplicas	No	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	No	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).

参数	是否必选	参数类型	描述
readyReplicas	No	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
updateRevision	No	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)
updatedReplicas	No	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.
collisionCount	No	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision
conditions	No	Array of StatefulSetCondition objects	Represents the latest available observations of a statefulset's current state.

表 6-209 StatefulSetSpec 字段数据结构说明

参数	是否必选	参数类型	描述
replicas	No	Integer	Replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1. replicas为1表示单个Pod，没有高可用能力，建议设置为多个。
priority	No	Integer	负载优先级，数值越大优先级越高，默认值为0。 取值范围：[-10, 10]

参数	是否必选	参数类型	描述
podManagementPolicy	No	String	<p>podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down.</p> <p>can be: OrderedReady, Parallel</p> <p>The default policy is OrderedReady, where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order.</p> <p>The alternative policy is Parallel which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.</p>
revisionHistoryLimit	No	Integer	<p>revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.</p>
updateStrategy	No	StatefulSetUpdateStrategy object	<p>updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.</p>
serviceName	Yes	String	<p>ServiceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.</p>

参数	是否必选	参数类型	描述
volumeClaimTemplates	No	PersistentVolumeClaim object	VolumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name. 注意：当前仅支持挂载EVS云硬盘卷
selector	Yes	labelSelector object	Selector is a label query over pods that should match the replica count. If empty, defaulted to labels on the pod template.
template	Yes	PodTemplateSpec object	Template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.

表 6-210 StatefulSetUpdateStrategy 字段数据结构说明

参数	是否必选	参数类型	描述
rollingUpdate	No	RollingUpdateStatefulSetStrategy object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.

参数	是否必选	参数类型	描述
type	No	String	Type indicates the type of the StatefulSetUpdateStrategy. can be: - RollingUpdate : indicates that update will be applied to all Pods in the StatefulSet with respect to the StatefulSet ordering constraints. When a scale operation is performed with this strategy, new Pods will be created from the specification version indicated by the StatefulSet's updateRevision. - OnDelete : triggers the legacy behavior. Version tracking and ordered rolling restarts are disabled. Pods are recreated from the StatefulSetSpec when they are manually deleted. When a scale operation is performed with this strategy, specification version indicated by the StatefulSet's currentRevision.

表 6-211 RollingUpdateStatefulSetStrategy 字段数据结构说明

参数	是否必选	参数类型	描述
partition	No	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned.

表 6-212 StatefulSetCondition 字段数据结构说明

参数	是否必选	参数类型	描述
type	No	String	Type of the condition. Currently only Ready.
status	No	String	Status of the condition. Can be True, False, or Unknown.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.

参数	是否必选	参数类型	描述
reason	No	String	Unique, one-word, CamelCase reason for the condition's last transition.
message	No	String	Human-readable message indicating details about last transition.

表 6-213 PersistentVolumeClaim 数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
metadata	ObjectMeta object	Standard object's metadata.
spec	PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author.
status	PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only.

表 6-214 PersistentVolumeClaimStatus 字段数据结构说明

参数	是否必选	参数类型	描述
accessModes	No	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. ReadWriteOnce - can be mounted read/write mode to exactly 1 host ReadOnlyMany - can be mounted in read-only mode to many hosts ReadWriteMany - can be mounted in read/write mode to many hosts
capacity	No	Array of ResourceName objects	Represents the actual resources of the underlying volume.
phase	No	String	Phase represents the current phase of PersistentVolumeClaim. pending - used for PersistentVolumeClaims that are not yet bound Bound - used for PersistentVolumeClaims that are bound Lost - used for PersistentVolumeClaims that lost their underlying PersistentVolume. The claim was bound to a PersistentVolume and this volume does not exist any longer and all data on it was lost.
conditions	No	Array of PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to ResizeStarted.

表 6-215 PersistentVolumeClaimCondition 字段数据结构说明

参数	是否必选	参数类型	描述
type	No	String	Type of the condition. Currently only Ready. Resizing - An user trigger resize of pvc has been started
status	No	String	Status of the condition. Can be True, False, or Unknown.
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
reason	No	String	Unique, one-word, CamelCase reason for the condition's last transition.
message	No	String	Human-readable message indicating details about last transition.

表 6-216 PersistentVolumeClaimSpec 字段数据结构说明

参数	是否必选	参数类型	描述
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.
accessModes	Yes	Array of strings	AccessModes contains the desired access modes the volume should have. ReadWriteOnce – the volume can be mounted as read-write by a single node ReadOnlyMany – the volume can be mounted read-only by many nodes ReadWriteMany – the volume can be mounted as read-write by many nodes
resources	Yes	ResourceRequirements object	Resources represents the minimum resources the volume should have.

参数	是否必选	参数类型	描述
selector	No	labelSelector object	A label query over volumes to consider for binding.
storageClassName	Yes	String	Name of the StorageClass required by the claim. 支持如下字段： <ul style="list-style-type: none"> 云硬盘存储卷（EVS） 当前支持高I/O（sas）、超高I/O（ssd）和普通I/O（sata） 文件存储卷（SFS） 当前支持标准文件协议类型（nfs-rw）
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Can be: <ul style="list-style-type: none"> - Block: the volume will not be formatted with a filesystem and will remain a raw block device - Filesystem: the volume will be or is formatted with a filesystem

表 6-217 StatefulSetList v1 apps 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
-	No	ListMeta object	-
items	Yes	Array of StatefulSet objects	Items is the list of StatefulSets

表 6-218 Job 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
metadata	Yes	ObjectMeta object	Standard list metadata.
spec	Yes	JobSpec object	Specification of the desired behavior of a job
status	No	JobStatus object	Current status of a job

表 6-219 JobStatus 字段数据结构说明

参数	是否必选	参数类型	描述
active	No	Integer	The number of actively running pods.
completionTime	No	Time	Replicas is the number of actual replicas.
conditions	No	Array of JobCondition objects	The latest available observations of an object's current state. More info:
failed	No	Integer	The number of pods which reached phase Failed.
startTime	No	Time	Represents time when the job was acknowledged by the job controller. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
succeeded	No	Integer	The number of pods which reached phase Succeeded.

表 6-220 JobSpec 字段数据结构说明

参数	是否必选	参数类型	描述
activeDeadlineSeconds	No	Integer	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer
backoffLimit	No	Integer	Specifies the number of retries before marking this job failed. Defaults to 6.
priority	No	Integer	任务优先级，数值越大优先级越高，默认值为0。 取值范围：[-10, 10]
completions	No	Integer	Specifies the desired number of successfully finished pods the job should be run with. Setting to nil means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job.
manualSelector	No	Boolean	manualSelector controls generation of pod labels and pod selectors. Leave manualSelector unset unless you are certain what you are doing. When false or unset, the system picks labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see manualSelector=true in jobs that were created with the old extensions/v1beta1 API.

参数	是否必选	参数类型	描述
parallelism	No	Integer	Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when $(.spec.completions - .status.successful) < .spec.parallelism$, i.e. when the work left to do is less than max parallelism.
selector	Yes	labelSelector object	Selector is a label query over pods that should match the replica count. If empty, defaulted to labels on the pod template.
template	Yes	PodTemplateSpec object	Template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.

表 6-221 JobCondition 字段数据结构说明

参数	是否必选	参数类型	描述
lastProbeTime	No	String	Last time the condition was checked.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
message	No	String	Human readable message indicating details about last transition
reason	No	String	(brief) reason for the condition's last transition.
status	No	String	Status of the condition, one of True, False, Unknown.
type	No	String	Type of job condition, Complete or Failed.

表 6-222 Service v1 core 数据结构描述

参数	是否必选	参数类型	描述
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is Service .
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
metadata	Yes	ObjectMeta object	-
spec	Yes	ServiceSpec object	-
status	No	ServiceStatus object	-

表 6-223 ServiceSpec 字段数据结构说明

参数	是否必选	参数类型	描述
ports	Yes	Array of ServicePort objects	The list of ports that are exposed by this service.
selector	No	Object	This service will route traffic to pods having labels matching this selector. Label keys and values that must match in order to receive traffic for this service. If empty, all pods are selected, if not specified, endpoints must be manually specified.

参数	是否必选	参数类型	描述
clusterIP	No	String	<p>clusterIP is the IP address of the service and is usually assigned randomly by the master. If an address is specified manually and is not in use by others, it will be allocated to the service; otherwise, creation of the service will fail. This field cannot be changed through updates. Valid values are "None", empty string (""), or a valid IP address.</p> <p>"None" can be specified for headless services when proxying is not required. Only applies to types ClusterIP, NodePort, and LoadBalancer. Ignored if type is ExternalName.</p>
type	No	String	<p>type determines how the Service is exposed. Defaults to ClusterIP. Valid options are ExternalName, ClusterIP and LoadBalancer.</p> <p>"ExternalName" maps to the specified externalName.</p> <p>"ClusterIP" allocates a cluster-internal IP address for load-balancing to endpoints. Endpoints are determined by the selector or if that is not specified, by manual construction of an Endpoints object. If clusterIP is "None", no virtual IP is allocated and the endpoints are published as a set of endpoints rather than a stable IP.</p> <p>"LoadBalancer" builds on NodePort and creates an external load-balancer (if supported in the current cloud) which routes to the clusterIP.</p> <p>说明 社区版本支持nodePort类型的service，CCI场景下不支持该类型的service</p>

参数	是否必选	参数类型	描述
externalIPs	No	Array of strings	externalIPs is a list of IP addresses for which nodes in the cluster will also accept traffic for this service. These IPs are not managed by Kubernetes. The user is responsible for ensuring that traffic arrives at a node with this IP. A common example is external load-balancers that are not part of the Kubernetes system.
externalTrafficPolicy	No	String	externalTrafficPolicy denotes if this Service desires to route external traffic to node-local or cluster-wide endpoints. valid values are "Local" and "Cluster" <ul style="list-style-type: none">- "Local" preserves the client source IP and avoids a second hop for LoadBalancer and Nodeport type services, but risks potentially imbalanced traffic spreading.- "Cluster" obscures the client source IP and may cause a second hop to another node, but should have good overall load-spreading.
healthCheckNodePort	No	Integer	healthCheckNodePort specifies the healthcheck nodePort for the service. If not specified, HealthCheckNodePort is created by the service api backend with the allocated nodePort. Will use user-specified nodePort value if specified by the client. Only effects when Type is set to LoadBalancer and ExternalTrafficPolicy is set to Local.

参数	是否必选	参数类型	描述
externalName	No	String	externalName is the external reference that kubedns or equivalent will return as a CNAME record for this service. No proxying will be involved. Must be a valid DNS name and requires Type to be ExternalName.
sessionAffinity	No	String	Used to maintain session affinity. Enable client IP based session affinity. Must be ClientIP or None. Defaults to None.
loadBalancerIP	No	String	Only applies to Service Type: LoadBalancer LoadBalancer will get created with the IP specified in this field. This feature depends on whether the underlying cloud-provider supports specifying the loadBalancerIP when a load balancer is created. This field will be ignored if the cloud-provider does not support the feature.
loadBalancerSourceRanges	No	Array of strings	Optional: If specified and supported by the platform, this will restrict traffic through the cloud-provider.load-balancer will be restricted to the specified client IPs. This field will be ignored if the cloud-provider does not support the feature.

参数	是否必选	参数类型	描述
publishNotReadyAddresses	No	Boolean	publishNotReadyAddresses, when set to true, indicates that DNS implementations must publish the notReadyAddresses of subsets for the Endpoints associated with the Service. The default value is false. The primary use case for setting this field is to use a StatefulSet's Headless Service to propagate SRV records for its Pods without respect to their readiness for purpose of peer discovery. This field will replace the service.alpha.kubernetes.io/tolerate-unready-endpoints when that annotation is deprecated and all clients have been converted to use this field.
sessionAffinityConfig	No	SessionAffinityConfig object	sessionAffinityConfig contains the configurations of session affinity.

表 6-224 ServiceStatus 字段数据结构说明

参数	是否必选	参数类型	描述
loadBalancer	No	loadBalancerStatus object	LoadBalancer contains the current status of the load-balancer, if one is present

表 6-225 ServicePort 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	<p>The name of this port within the service. This must be a DNS_LABEL. All ports within a ServiceSpec must have unique names. This maps to the 'Name' field in EndpointPort objects. Optional if only one ServicePort is defined on this service.</p> <p>Value length: 0 character < String length ≤ 63 characters.</p> <p>The string must comply with regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.</p>
protocol	No	String	<p>The IP protocol for this port. Supports "TCP" and "UDP".</p> <p>This parameter can be set to:</p> <ul style="list-style-type: none">• TCP• UDP
port	Yes	Integer	<p>The port that will be exposed by this service.</p> <p>Value range: (0,65535].</p>
targetPort	No	String	<p>Number or name of the port to access on the pods targeted by the service. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME. If this is a string, it will be looked up as a named port in the target Pod's container ports. If this is not specified, the value of Port is used (an identity map). Defaults to the service port.</p> <p>Value range: (0,65535].</p>

参数	是否必选	参数类型	描述
nodePort	No	Integer	The port on each node on which this service is exposed when type=NodePort or LoadBalancer. Usually assigned by the system. If specified, it will be allocated to the service if unused or else creation of the service will fail. Default is to auto-allocate a port if the ServiceType of this Service requires one. Value range: [30000,32767].

表 6-226 loadBalancerStatus 数据结构说明

参数	是否必选	参数类型	描述
ingress	No	Array of LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 6-227 LoadBalancerIngress 字段数据结构说明

参数	是否必选	参数类型	描述
ip	No	String	IP is set for load-balancer ingress points that are IP based.
hostname	No	String	Hostname is set for load-balancer ingress points that are DNS based.

表 6-228 SessionAffinityConfig 字段数据结构说明

参数	是否必选	参数类型	描述
clientIP	No	ClientIPConfig object	clientIP contains the configurations of Client IP based session affinity.

表 6-229 ClientIPConfig 字段数据结构说明

参数	是否必选	参数类型	描述
timeoutSeconds	No	Integer	timeoutSeconds specifies the seconds of ClientIP type session sticky time. The value must be >0 && <=86400(for 1 day) if ServiceAffinity == "ClientIP". Default value is 10800(for 3 hours).

表 6-230 ServiceList 数据结构说明

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	ListMeta object	Standard list metadata.
items	Array of Service objects	List of services.

表 6-231 Ingress v1beta1 extensions 数据结构

参数	是否必选	参数类型	描述
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.

参数	是否必选	参数类型	描述
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
metadata	No	ObjectMeta object	Standard object's metadata.
spec	No	IngressSpec object	Spec is the desired state of the Ingress.
status	No	IngressStatus	Status is the current state of the Ingress.

表 6-232 IngressSpec 字段数据结构说明

参数	是否必选	参数类型	描述
backend	No	IngressBackend object	A default backend capable of servicing requests that do not match any rule. At least one of <i>backend</i> or <i>rules</i> must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
rules	No	Array of IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	No	Array of IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 6-233 IngressStatus 字段数据结构说明

参数	是否必选	参数类型	描述
loadBalancer	No	loadBalancer Status object	LoadBalancer contains the current status of the load-balancer.

表 6-234 IngressBackend 字段数据结构说明

参数	是否必选	参数类型	描述
serviceName	No	String	Specifies the name of the referenced service.
servicePort	No	String	Specifies the port of the referenced service.

表 6-235 IngressTLS 数据结构说明

参数	是否必选	参数类型	描述
hosts	No	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	No	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing

表 6-236 IngressRule 数据结构说明

参数	是否必选	参数类型	描述
host	No	String	ost is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in the RFC: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue
http	No	IngressRuleValue object	IngressRuleValue represents a rule to route requests for this IngressRule.If unspecified, the rule defaults to an http catch-all. Whether that sends just traffic matching the host to the default backend or all traffic to the default backend, is left to the controller fulfilling the Ingress. Http is currently the only supported IngressRuleValue.

表 6-237 IngressRuleValue 数据结构说明

参数	是否必选	参数类型	描述
http	No	HTTPIngressRuleValue object	HTTP ingress rule.

表 6-238 HTTPIngressRuleValue 数据结构说明

参数	是否必选	参数类型	描述
paths	No	Array of HTTPIngressPath objects	A collection of paths that map requests to backends.

表 6-239 HTTPIngressPath 数据结构说明

参数	是否必选	参数类型	描述
path	No	String	Path is an extended POSIX regex as defined by IEEE Std 1003.1, (i.e this follows the egrep/unix syntax, not the perl syntax) matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. If unspecified, the path defaults to a catch all sending traffic to the backend
backend	Yes	Ingress Backend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to
property	Yes	Object	Extension property on the path

表 6-240 loadBalancerStatus 字段数据结构说明

参数	是否必选	参数类型	描述
ingress	No	Array of LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 6-241 IngressList 数据结构说明

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.

参数	参数类型	描述
metadata	ListMeta object	Standard list metadata.
items	Array of Ingress v1beta1 extensions objects	List of Ingress.

表 6-242 Configmap v1 core 请求参数

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
metadata	Yes	ObjectMeta object	Standard list metadata.
data	Yes	Object	Data contains the configuration data. Each key must consist of alphanumeric characters, '-', '_' or '.'. value值最大长度为512.

表 6-243 ConfigmapList 数据结构说明

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	ListMeta object	Standard list metadata.
items	Array of Configmap v1 core objects	List of Configmap.

表 6-244 Secret v1 core 数据结构说明

参数	是否必选	参数类型	描述
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is Secret .
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
metadata	Yes	ObjectMeta object	-
data	No	Object	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string , representing the arbitrary (possibly non-string) data value here
stringData	No	Object	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API

参数	是否必选	参数类型	描述
type	No	String	Used to facilitate programmatic handling of secret data. The primitive k8s supports the following secret types, for details, see 表6-245 . <ul style="list-style-type: none"> • Opaque • kubernetes.io/dockercfg • kubernetes.io/dockerconfigjson • kubernetes.io/tls

表 6-245 不同类型 secret 对应的 data 中 key 值约束

secret类型	data中必须含有的key值	描述
Opaque	无	secret type Opaque is the default; arbitrary user-defined data
kubernetes.io/dockercfg	.dockercfg	secret type kubernetes.io/dockercfg contains a dockercfg file that follows the same format rules as ~/.dockercfg
kubernetes.io/tls	tls.key tls.crt	secret type kubernetes.io/tls contains information about a TLS client or server secret. It is primarily used with TLS termination of the Ingress resource, but may be used in other types.
kubernetes.io/dockerconfigjson	.dockerconfigjson	SecretTypeDockerConfigJson contains a dockercfg file that follows the same format rules as ~/.docker/config.json

表 6-246 ServiceList 数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
metadata	ListMeta object	Standard list metadata.
items	Array of Secret v1 core objects	List of Secrets.

表 6-247 PersistentVolumeClaimList v1 core 数据结构说明

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
metadata	ListMeta object	Standard list metadata.
items	Array of PersistentVolumeClaim object	A list of persistent volume claims.

表 6-248 Event v1 core 数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
count	integer	The number of times this event has occurred.
firstTimestamp	Time	The time at which the event was first recorded. (Time of server receipt is in TypeMeta.)
involvedObject	involvedObject object	The object that this event is about.
lastTimestamp	Time	The time at which the most recent occurrence of this event was recorded.
message	String	A human-readable description of the status of this operation.
metadata	metadata object	Standard object's metadata.
reason	String	This should be a short, machine understandable string that gives the reason for the transition into the object's current status.
source	EventSource object	The component reporting this event. Should be a short machine understandable string.
type	String	Type of this event (Normal, Warning), new types could be added in the future
eventTime	time.Time	Time when this Event was first observed.
Series	EventSeries object	Data about the Event series this event represents or nil if it is a singleton Event.
action	String	What action was taken/failed regarding to the Regarding object.
related	ObjectReference object	Optional secondary object for more complex actions.
reportingComponent	String	Name of the controller that emitted this Event, e.g. `kubernetes.io/kubelet`
reportingInstance	String	ID of the controller instance, e.g. `kubelet-xyzf`.

表 6-249 involvedObject 字段数据结构说明

参数	参数类型	描述
kind	String	Kind of the referent.
namespace	String	Namespace of the referent.
name	String	Name of the referent.
uid	String	UID of the referent.
apiVersion	String	API version of the referent.
resourceVersion	String	Specific resourceVersion to which this reference is made.
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.

表 6-250 EventSource 字段数据结构说明

参数	参数类型	描述
component	String	Component from which the event is generated.
host	String	Node name on which the event is generated.

表 6-251 EventSerie 数据结构说明

参数	参数类型	描述
count	<i>integer</i>	Number of occurrences in this series up to the last heartbeat time

参数	参数类型	描述
lastObservedTime	time.Time	Time of the last occurrence observed
state	String	State of this Series: Ongoing 、 Finished or Unknown

表 6-252 ObjectReference 字段数据结构说明

参数	参数类型	描述
apiVersion	String	API version of the referent.
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as desiredState.manifest.containers[2]. For example, if the object reference is to a container within a pod, this would take on a value like: "spec.containers{name}" (where "name" refers to the name of the container that triggered the event) or if no container name is specified "spec.containers[2]" (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent.
name	String	Name of the referent.
namespace	String	Namespace of the referent.
resourceVersion	String	Specific resourceVersion to which this reference is made, if any.
uid	String	UID of the referent.

表 6-253 EventList v1 core 数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.

参数	参数类型	描述
items	Array of Event v1 core objects	List of services
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	ListMeta object	Standard list metadata.

表 6-254 LocalDirVolumeSource 数据结构说明

参数	参数类型	描述
sizeLimit	Object	所使用的localDir存储大小。

表 6-255 emptyDir 数据结构说明

参数	参数类型	描述
sizeLimit	integer	所使用的emptyDir存储大小。 取值：(0, 2147483647] 单位：Gi。
medium	String	介质类型，可设置为： <ul style="list-style-type: none">LocalVolume：使用磁盘类型为超高IO的云硬盘。LocalSSD：使用本地SSD。 说明 若不设置，默认使用超高IO的云硬盘。

表 6-256 Endpoints 数据结构说明

参数	参数类型	描述
kind	String	String Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is Secret .
apiVersion	String	String APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
metadata	ObjectMetadata object	-
subsets	Array of EndpointSubset objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

表 6-257 EndpointSubset 数据结构说明

参数	参数类型	描述
addresses	Array of EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	参数类型	描述
notReadyAddresses	Array of EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of EndpointPort objects	Port numbers available on the related IP addresses.

表 6-258 EndpointAddress 数据结构说明

参数	参数类型	描述
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24) IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready
hostname	String	The Hostname of this endpoint
nodename	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	ObjectReference object	Reference to object providing the endpoint.
nodeAvailabilityZone	String	Optional: The availability zone of the endpoint's host node

表 6-259 EndpointPort 数据结构说明

参数	参数类型	描述
name	String	The name of this port (corresponds to ServicePort.Name). Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP or TCP. Default is TCP

表 6-260 EndpointsList v1 core 数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
items	Array of Endpoints objects	List of endpoints
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	ListMeta object	Standard list metadata.

表 6-261 ReplicaSet 数据结构说明

参数	参数类型	描述
kind	String	String Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is Secret .

参数	参数类型	描述
apiVersion	String	String APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
metadata	ObjectMeta object	-
spec	ReplicaSetSpec object	Spec defines the specification of the desired behavior of the ReplicaSet.
status	ReplicaSetStatus object	Status is the most recently observed status of the ReplicaSet. This data may be out of date by some window of time. Populated by the system. Read-only.

表 6-262 ReplicaSetSpec 数据结构说明

参数	参数类型	描述
replicas	Integer	Replicas is the number of desired replicas. This is a pointer to distinguish between explicit zero and unspecified. Defaults to 1.
minReadySeconds	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available。 Defaults to 0 (pod will be considered available as soon as it is ready)
selector	LabelSelector object	Selector is a label query over pods that should match the replica count. Label keys and values that must match in order to be controlled by this replica set. It must match the pod template's labels.
template	PodTemplateSpec object	Template is the object that describes the pod that will be created if insufficient replicas are detected.

表 6-263 ReplicaSetStatus 数据结构说明

参数	参数类型	描述
replicas	Integer	Replicas is the most recently observed number of replicas.
fullyLabeledReplicas	Integer	The number of pods that have labels matching the labels of the pod template of the replicaset.
readyReplicas	Integer	The number of ready replicas for this replica set.
availableReplicas	Integer	The number of available replicas (ready for at least minReadySeconds) for this replica set.
observedGeneration	Integer	ObservedGeneration reflects the generation of the most recently observed ReplicaSet.
conditions	ReplicaSetCondition object	Represents the latest available observations of a replica set's current state.

表 6-264 ReplicaSetCondition 数据结构说明

参数	参数类型	描述
type	String	Type of replica set condition. Available Values: -- ReplicaFailure: ReplicaSetReplicaFailure is added in a replica set when one of its pods fails to be created due to insufficient quota, limit ranges, pod security policy, node selectors, etc. or deleted due to kubelet being down or finalizers are failing.
status	String	Status of the condition, one of True, False, Unknown.
lastTransitionTime	Object	The last time the condition transitioned from one status to another.
reason	String	The reason for the condition's last transition.
message	String	A human readable message indicating details about the transition.

表 6-265 ReplicaSetList v1 core 数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
items	Array of ReplicaSet objects	List of endpoints
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	ListMeta object	Standard list metadata.

表 6-266 Volcano Job batch_v1alpha1 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources .
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds .
metadata	Yes	ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata .

参数	是否必选	参数类型	描述
spec	Yes	VolcanoJobSpec object	Specification of the desired behavior of a cron job, including the minAvailable.
status	No	VolcanoJobStatus object	Current status of Job.

表 6-267 VolcanoJobSpec 字段数据结构说明

参数	是否必选	参数类型	描述
maxRetry	No	Integer	The limit for retrying submitting job, default is 3.
minAvailable	Yes	Integer	The minimal available pods to run for this Job. 该参数值大于0。
plugins	No	VolcanoPlugin object	Enabled task plugins when creating job.
policies	No	Array of VolcanoJobPolicy objects	Specifies the default lifecycle of tasks.
queue	No	String	The name of the queue on which job should be created.
schedulerName	No	String	SchedulerName is the default value of `tasks.template.spec.schedulerName`.
tasks	Yes	Array of VolcanoJobTask objects	Tasks specifies the task specification of Job.
volumes	No	Array of VolcanoJobVolume objects	The volumes for Job.

表 6-268 VolcanoJobStatus 字段数据结构说明

参数	是否必选	参数类型	描述
ControlledResources	Yes	Object	All of the resources that are controlled by this job. { "plugin-env": "env", "plugin-ssh": "ssh", "plugin-svc": "svc" }.

参数	是否必选	参数类型	描述
Succeeded	No	Integer	The number of pods which reached phase Succeeded.
failed	No	Integer	The number of pods which reached phase Failed.
minAvailable	Yes	Integer	The minimal available pods to run for this Job.
pending	No	Integer	The number of pending pods.
retryCount	No	Integer	The number that volcano retried to submit the job.
running	No	Integer	The number of running pods.
version	No	Integer	Job's current version.
state	Yes	VolcanoJobStatusState object	Current state of Job.

表 6-269 VolcanoJobPolicy 字段数据结构说明

参数	是否必选	参数类型	描述
action	Yes	String	The action that will be taken to the PodGroup according to Event. One of \"Restart\", \"None\". Default to None.
event	Yes	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	No	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 6-270 VolcanoJobTask 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name specifies the name of tasks.
policies	No	VolcanoJobPolicy object	Specifies the lifecycle of task.
replicas	No	Integer	Replicas specifies the replicas of this TaskSpec in Job.

表 6-273 VolcanoTaskVolumeClaimSpec 字段数据结构说明

参数	是否必选	参数类型	描述
accessModes	Yes	Array of strings	AccessModes contains the desired access modes the volume should have. ReadWriteOnce – the volume can be mounted as read-write by a single node ReadOnlyMany – the volume can be mounted read-only by many nodes ReadWriteMany – the volume can be mounted as read-write by many nodes
resources	Yes	ResourceRequirements object	Resources represents the minimum resources the volume should have.
storageClassName	Yes	String	Name of the StorageClass required by the claim. 支持如下字段： <ul style="list-style-type: none"> 云硬盘存储卷（EVS）当前支持高I/O（sas）、超高I/O（ssd）和普通I/O（sata）。 文件存储卷（SFS）当前支持标准文件协议类型（nfs-rw）。

表 6-274 VolcanoPlugin 字段数据结构说明

参数	是否必选	参数类型	描述
env	No	Array of strings	Set VK_TASK_INDEX to each container, is a index for giving the identity to container.
svc	No	Array of strings	Create Service and *.host to enable pods communicate.
ssh	No	Array of strings	Sign in ssh without password, e.g. use command mpirun or mpiexec. 可填写值“no-root”表明ssh登录为非root用户登录。

表 6-275 TFJob kubeflow_v1 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is TFJob .
metadata	Yes	ObjectMeta object	Standard object's metadata.
spec	Yes	TFJobSpec object	Specification of the desired behavior of a tfjob.
status	No	JobStatus object	Current status of TFJob.

表 6-276 TFJobSpec 字段数据结构说明

参数	是否必选	参数类型	描述
activeDeadlineSeconds	No	Integer	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer.
backoffLimit	No	Integer	Optional number of retries before marking this job failed.
cleanPodPolicy	No	CleanPodPolicy object	CleanPodPolicy defines the policy to kill pods after TFJob is succeeded. Default to Running.
ttlSecondsAfterFinished	No	Integer	TTLSecondsAfterFinished is the TTL to clean up tf-jobs (temporary before kubernetes adds the cleanup controller). It may take extra ReconcilePeriod seconds for the cleanup, since reconcile gets called periodically.

参数	是否必选	参数类型	描述
tfReplicaSpecs	Yes	Array of ReplicaSpec objects	TFReplicaSpecs is map of TFReplicaType and ReplicaSpec specifies the TF replicas to run. For example, { "PS": ReplicaSpec, "Worker": ReplicaSpec, }

表 6-277 CleanPodPolicy 字段可选值说明

可选值	描述
All	When the job is finished, kill all pods that the job created.
Running	When the job is finished, kill pods that the job created and is in running phase.
None	When the job is finished, do not kill any pods that the job created.

表 6-278 TFReplicaType 字段可选值说明

可选值	描述
PS	PS is the type for parameter servers of distributed TensorFlow.
Worker	Worker is the type for workers of distributed TensorFlow. This is also used for non-distributed TensorFlow.
Chief	Chief is the type for chief worker of distributed TensorFlow. If there is "chief" replica type, it's the "chief worker". Else, worker:0 is the chief worker.
Evaluator	Evaluator is the type for evaluation replica in TensorFlow.

表 6-279 ReplicaSpec 字段数据结构说明

参数	是否必选	参数类型	描述
replicas	No	Integer	Replicas is the desired number of replicas of the given template. If unspecified, defaults to 1.
template	Yes	PodTemplateSpec object	Template is the object that describes the pod that will be created for this replica. RestartPolicy in PodTemplateSpec will be override by RestartPolicy in ReplicaSpec.
restartPolicy	No	String	Restart policy for all replicas within the job. One of Always, OnFailure, Never and ExitCode. Default to Never.

表 6-280 JobStatus 字段数据结构说明

参数	是否必选	参数类型	描述
conditions	No	Array of JobCondition objects	Conditions is an array of current observed job conditions.
replicaStatuses	No	Array of ReplicaStatus objects	ReplicaStatuses is map of ReplicaType and ReplicaStatus, specifies the status of each replica.
startTime	No	Time	Represents time when the job was acknowledged by the job controller. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
completionTime	No	Time	Represents time when the job was completed. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.
lastReconcileTime	No	Time	Represents last time when the job was reconciled. It is not guaranteed to be set in happens-before order across separate operations. It is represented in RFC3339 form and is in UTC.

表 6-281 JobCondition 字段数据结构说明

参数	是否必选	参数类型	描述
type	No	String	Type of job condition. 说明 Job的状态有: -Created: means the job has been accepted by the system, but one or more of the pods/services has not been started. This includes time before pods being scheduled and launched. -Running: means all sub-resources (e.g. services/pods) of this job have been successfully scheduled and launched. The training is running without error. -Restarting: means one or more sub-resources (e.g. services/pods) of this job reached phase failed but maybe restarted according to it's restart policy which specified by user in v1.PodTemplateSpec. The training is freezing/pending. -Succeeded: means all sub-resources (e.g. services/pods) of this job reached phase have terminated in success. The training is complete without error. -Failed: means one or more sub-resources (e.g. services/pods) of this job reached phase failed with no restarting. The training has failed its execution.
status	No	String	Status of the condition, one of True, False, Unknown.
reason	No	String	(brief) reason for the condition's last transition.
message	No	String	Human readable message indicating details about last transition
lastUpdateTime	No	Time	The last time this condition was updated.
lastTransitionTime	No	Time	Last time the condition transitioned from one status to another.

表 6-282 ReplicaStatus 字段数据结构说明

参数	是否必选	参数类型	描述
active	No	Integer	The number of actively running pods.

参数	是否必选	参数类型	描述
succeeded	No	Integer	The number of pods which reached phase Succeeded.
failed	No	Integer	The number of pods which reached phase Failed.

表 6-283 MXJob kubeflow_v1 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is MXJob .
metadata	Yes	ObjectMetadata object	Standard object's metadata.
spec	Yes	MXJobSpec	Specification of the desired behavior of a mxjob.
status	No	JobStatus object	Current status of MXJob.

表 6-284 MXJobSpec 字段数据结构说明

参数	是否必选	参数类型	描述
activeDeadlineSeconds	No	Integer	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer.
backoffLimit	No	Integer	Optional number of retries before marking this job failed.

参数	是否必选	参数类型	描述
cleanPodPolicy	No	CleanPodPolicy object	CleanPodPolicy defines the policy to kill pods after TFJob is succeeded. Default to Running.
ttlSecondsAfterFinished	No	Integer	TTLSecondsAfterFinished is the TTL to clean up tf-jobs (temporary before kubernetes adds the cleanup controller). It may take extra ReconcilePeriod seconds for the cleanup, since reconcile gets called periodically.
mxReplicaSpecs	Yes	Array of ReplicaSpec objects	MXReplicaSpecs is map of MXReplicaType and MXReplicaSpec specifies the MX replicas to run. For example, { "Scheduler": MXReplicaSpec, "Server": MXReplicaSpec, "Worker": MXReplicaSpec, }

表 6-285 MXReplicaType 字段可选值说明

可选值	描述
Scheduler	Scheduler is the type for scheduler replica in MXNet.
Worker	Worker is the type for workers of distributed MXNet.
Server	Server is the type for parameter servers of distributed MXNet.

表 6-286 PyTorchJob kubeflow_v1 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1 .
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is PyTorchJob .
metadata	Yes	ObjectMeta object	Standard object's metadata.
spec	Yes	PyTorchJobSpec object	Specification of the desired behavior of a pytorchjob.
status	No	JobStatus object	Current status of pytorchJob.

表 6-287 PyTorchJobSpec 字段数据结构说明

参数	是否必选	参数类型	描述
activeDeadlineSeconds	No	Integer	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer.
backoffLimit	No	Integer	Optional number of retries before marking this job failed.
cleanPodPolicy	No	CleanPodPolicy object	CleanPodPolicy defines the policy to kill pods after TFJob is succeeded. Default to Running.
ttlSecondsAfterFinished	No	Integer	TTLSecondsAfterFinished is the TTL to clean up tf-jobs (temporary before kubernetes adds the cleanup controller). It may take extra ReconcilePeriod seconds for the cleanup, since reconcile gets called periodically.

参数	是否必选	参数类型	描述
ReplicaSpecs	Yes	Array of ReplicaSpec objects	A map of PyTorchReplicaType (type) to ReplicaSpec (value). Specifies the PyTorch cluster configuration. For example, { "Master": PyTorchReplicaSpec, "Worker": PyTorchReplicaSpec, }

表 6-288 PytorchReplicaType 字段可选值说明

可选值	描述
Master	Master is the type of Master of distributed PyTorch.
Worker	Worker is the type for workers of distributed PyTorch.

表 6-289 TFJobList kubeflow_v1 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	No	ListMeta object	Standard type metadata.
items	Yes	Array of TFJob kubeflow_v1 objects	Lists of tfjobs.

表 6-290 MXJobList kubeflow_v1 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	No	ListMeta object	Standard type metadata.
items	Yes	Array of MXJob kubeflow_v1 objects	Lists of mxjobs.

表 6-291 PyTorchJobList kubeflow_v1 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	No	ListMeta object	Standard type metadata.
items	Yes	Array of PyTorchJob kubeflow_v1 objects	Lists of pytorchjobs.

表 6-292 MPIJob kubeflow_v1alpha2 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. The value of this parameter is v1alpha2 .
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. The value of this parameter is MPIJob .
metadata	Yes	ObjectMeta object	Standard object's metadata.
spec	Yes	MPIJobSpec object	Specification of the desired behavior of a mpijob.
status	No	JobStatus object	Current status of MPIJob.

表 6-293 MPIJobSpec 字段数据结构说明

参数	是否必选	参数类型	描述
activeDeadlineSecond	No	Integer	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer.
backoffLimit	No	Integer	Optional number of retries before marking this job failed.
cleanPodPolicy	No	CleanPodPolicy object	CleanPodPolicy defines the policy to kill pods after TFJob is succeeded. Default to Running.
slotsPerWorker	No	Integer	Specifies the number of slots per worker used in hostfile. Defaults to 1.

参数	是否必选	参数类型	描述
mpiReplicaSpecs	Yes	Array of ReplicaSpec objects	MPIReplicaSpecs is map of MPIReplicaType and MPIReplicaSpec specifies the MPI replicas to run. For example, { "Launcher": MPIReplicaSpec, "Worker": MPIReplicaSpec, }

表 6-294 MPIReplicaType 字段可选值说明

可选值	描述
Launcher	Launcher is the type for launcher replica in MPI.
Worker	Worker is the type for workers of distributed MPI.

表 6-295 MPIJobList kubeflow_v1alpha2 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	No	ListMeta object	Standard type metadata.
items	Yes	Array of MPIJob kubeflow_v1alpha2 objects	Lists of mpijobs.

表 6-296 PersistentVolumeClaim v1 数据结构说明

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
metadata	ListMeta v1 meta object	Standard object's metadata.
spec	PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requeste PersistentVolumeClaimStatus d by a pod author.
status	PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only.

表 6-297 ListMeta v1 meta 数据结构说明

名称	参数类型	描述
continue	string	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response
resourceVersion	string	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only
selfLink	string	SelfLink is a URL representing this object. Populated by the system. Read-only

表 6-298 PersistentVolumeClaimSpec 字段数据结构说明

参数	是否必选	参数类型	描述
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.
accessModes	Yes	Array of strings	AccessModes contains the desired access modes the volume should have. ReadWriteOnce – the volume can be mounted as read-write by a single node ReadOnlyMany – the volume can be mounted read-only by many nodes ReadWriteMany – the volume can be mounted as read-write by many nodes
resources	Yes	ResourceRequirements object	Resources represents the minimum resources the volume should have.
selector	No	labelSelector object	A label query over volumes to consider for binding.
storageClassName	Yes	String	Name of the StorageClass required by the claim. 支持如下字段： <ul style="list-style-type: none"> 云硬盘存储卷（EVS） 当前支持高I/O（sas）、超高I/O（ssd）和普通I/O（sata）。 文件存储卷（SFS） 当前支持标准文件协议类型（nfs-rw）。 极速文件存储卷（SFS Turbo） 当前支持性能型极速文件存储卷（efs-performance）和标准型极速文件存储卷（efs-standard）。
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Can be: <ul style="list-style-type: none"> - Block: the volume will not be formatted with a filesystem and will remain a raw block device - Filesystem: the volume will be or is formatted with a filesystem

表 6-299 PersistentVolumeClaimStatus 字段数据结构说明

参数	是否必选	参数类型	描述
accessModes	No	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. ReadWriteOnce - can be mounted read/write mode to exactly 1 host ReadOnlyMany - can be mounted in read-only mode to many hosts ReadWriteMany - can be mounted in read/write mode to many hosts
capacity	No	Array of ResourceRequirements objects	Represents the actual resources of the underlying volume.
phase	No	String	Phase represents the current phase of PersistentVolumeClaim. pending - used for PersistentVolumeClaims that are not yet bound Bound - used for PersistentVolumeClaims that are bound Lost - used for PersistentVolumeClaims that lost their underlying PersistentVolume. The claim was bound to a PersistentVolume and this volume does not exist any longer and all data on it was lost.
conditions	No	Array of PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to ResizeStarted.

表 6-300 PersistentVolumeClaimCondition 字段数据结构说明

名称	是否必选	参数类型	描述
type	No	String	Type of the condition. Currently only Ready. Resizing - An user trigger resize of pvc has been started

名称	是否必选	参数类型	描述
status	No	String	Status of the condition. Can be True, False, or Unknown.
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
reason	No	String	Unique, one-word, CamelCase reason for the condition's last transition.
message	No	String	Human-readable message indicating details about last transition.

表 6-301 ResourceRequirements 字段数据结构说明

名称	是否必选	类型	描述
limits	No	Array of ResourceName objects	Maximum amount of compute resources allowed. 说明 limits和requests值必须相等，否则会报错。
requests	No	Array of ResourceName objects	Minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. 云容器实例中Pod规格有限制，具体的限制请参见 使用限制 页面的“Pod规格”部分。

表 6-302 ResourceName 字段可选值说明

参数类型	是否可选	参数类型	描述
storage	No	String	Volume size, in bytes (e.g. 5Gi = 5GiB = 5 * 1024 * 1024 * 1024)
cpu	No	String	CPU size, in cores. (500m = .5 cores)
memory	No	String	Memory size, in bytes. (500Gi = 500GiB = 500 * 1024 * 1024 * 1024)

参数类型	是否可选	参数类型	描述
localdir	No	String	Local Storage for LocalDir, in bytes. (500Gi = 500GiB = 500 * 1024 * 1024 * 1024)
nvidia.com/gpu-tesla-v100-16GB	No	String	NVIDIA GPU resource, the type may change in different environments, in production environment is nvidia.com/gpu-tesla-v100-16GB now. The value must be an integer and not less than 1.

表 6-303 labelSelector 字段数据结构说明

名称	是否必选	参数类型	描述
matchExpressions	No	Array of LabelSelector Requirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Object	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 6-304 LabelSelectorRequirement 字段数据结构说明

名称	是否必选	参数类型	描述
key	No	String	key is the label key that the selector applies to.
operator	No	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

名称	是否必选	参数类型	描述
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 6-305 PersistentVolume 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	Yes	metadata object	Standard object's metadata.
spec	Yes	spec object	Spec defines a specification of a persistent volume owned by the cluster. Provisioned by an administrator.
status	No	status object	Status represents the current information/status for the persistent volume. Populated by the system. Read-only.

表 6-306 spec 字段数据结构说明

参数	是否必选	参数类型	描述
accessModes	Yes	Array of strings	Access mode. Options: ReadWriteOnce: can be read and written by a single node. ReadOnlyMany: can only be read by multiple nodes. ReadWriteMany: can be read and written by multiple nodes.
capacity	Yes	Object	A description of the persistent volume's resources and capacity.
claimRef	No	claimRef object	ClaimRef is part of a bi-directional binding between PersistentVolume and PersistentVolumeClaim. Expected to be non-nil when bound. claim. VolumeName is the authoritative bind between PV and PVC.
hostPath	No	hostPath object	HostPath represents a directory on the host. Provisioned by a developer or tester. This is useful for single-node development and testing only! On-host storage is not supported in any way and WILL NOT WORK in a multi-node cluster.
nfs	No	nfs object	NFS represents an NFS mount on the host. Provisioned by an admin.
persistentVolumeReclaimPolicy	No	String	What happens to a persistent volume when released from its claim. Valid options are Retain (default) and Recycle. Recycling must be supported by the volume plugin underlying this persistent volume.
storageClassName	No	String	Name of StorageClass to which this persistent volume belongs. Empty value means that this volume does not belong to any StorageClass.

表 6-307 status 字段数据结构说明

参数	是否必选	参数类型	描述
message	No	String	A human-readable message indicating details about why the volume is in this state.
phase	No	String	Phase indicates if a volume is available, bound to a claim, or released by a claim.
reason	No	String	Reason is a brief CamelCase string that describes any failure and is meant for machine parsing and tidy display in the CLI.

表 6-308 claimRef 字段数据结构说明

参数	是否必选	参数类型	描述
apiVersion	No	String	API version of the referent.
fieldPath	No	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	No	String	Kind of the referent.
name	No	String	Name of the referent.
namespace	No	String	Namespace of the referent.
resourceVersion	No	String	Specific resourceVersion to which this reference is made, if any.

参数	是否必选	参数类型	描述
uid	No	String	UID of the referent.

表 6-309 hostPath 字段数据结构说明

参数	是否必选	参数类型	描述
path	No	String	Path of the directory on the host.

表 6-310 nfs 字段数据结构说明

参数	是否必选	参数类型	描述
path	No	String	Path that is exported by the NFS server.
readOnly	No	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false.
server	No	String	Server is the hostname or IP address of the NFS server.

表 6-311 metadata 字段数据结构说明

名称	是否必选	参数类型	描述
name	Yes	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. 0 characters < name length ≤ 253 characters. The name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.

名称	是否必选	参数类型	描述
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
initializers	No	initializers object	An initializer is a controller which enforces some system invariant at object creation time. This field is a list of initializers that have not yet acted on this object. If nil or empty, this object has been completely initialized. Otherwise, the object is considered uninitialized and is hidden (in list/watch and get calls) from clients that haven't explicitly asked to observe uninitialized objects. When an object is created, the system will populate this list with the current set of initializers. Only privileged users may set or modify this list. Once it is empty, it may not be modified further by any user.
enable	No	Boolean	Enable identify whether the resource is available.

名称	是否必选	参数类型	描述
generateName	No	String	<p>An optional prefix used by the server to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409. Instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified.</p> <p>0 characters < generated name length ≤ 253 characters.</p> <p>The generated name must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.</p>
namespace	No	String	<p>Namespace defines the space within each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated.</p> <p>0 characters < namespace length ≤ 63 characters.</p> <p>The namespace must be a regular expression [a-z0-9]([-a-z0-9]*[a-z0-9])?.</p>

名称	是否必选	参数类型	描述
selfLink	No	String	<p>A URL representing this object. Populated by the system. Read-only.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>
resourceVersion	No	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>
generation	No	Integer	<p>A sequence number representing a specific generation of the desired state. Currently only implemented by replication controllers. Populated by the system. Read-only.</p>

名称	是否必选	参数类型	描述
creationTimestamp	No	String	<p>A timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists.</p> <p>说明 This field is automatically generated. Do not assign any value to this field. Otherwise, API calls would fail.</p>
deletionTimestamp	No	String	<p>RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource will be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field. Once set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. Once the resource is deleted in the API, the Kubelet will send a hard termination signal to the container. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only.</p>
deletionGracePeriodSeconds	No	Integer	<p>Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.</p>

名称	是否必选	参数类型	描述
labels	Yes	Object	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services.</p> <p>说明 This field should be filled in to create the real storage dynamically. The value of the field is according to the real region and zone.</p>
annotations	No	annotations object	<p>An unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects.</p> <p>说明 This field should be filled in to create the real storage dynamically. This field indicates the storage plugin and the StorageClass.</p>
ownerReferences	No	ownerReferences object	<p>List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.</p>
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed.</p>

表 6-312 annotations 字段数据结构说明

参数	是否必须	参数类型	描述
volume.beta.kubernetes.io/storage-class	Yes	String	存储类型。 <ul style="list-style-type: none"> 云硬盘存储卷（EVS） 当前支持高I/O（sas）、超高I/O（ssd）和普通I/O（sata） 文件存储卷（SFS） 当前支持标准文件协议类型（nfs-rw）
volume.beta.kubernetes.io/storage-provisioner	Yes	String	挂载路径。 <ul style="list-style-type: none"> 存储类型为EVS时，配置为flexvolume-huawei.com/fuxivol 存储类型为SFS时，配置为flexvolume-huawei.com/fuxinfs

表 6-313 initializers 字段数据结构说明

参数	是否必选	参数类型	描述
pending	No	pending object	Pending is a list of initializers that must execute in order before this object is visible. When the last pending initializer is removed, and no failing result is set, the initializers struct will be set to nil and the object is considered as initialized and visible to all clients.
result	No	result object	If result is set with the Failure field, the object will be persisted to storage and then deleted, ensuring that other clients can observe the deletion.

表 6-314 pending 字段数据结构说明

参数	是否必选	参数类型	描述
name	No	String	name of the process that is responsible for initializing this object.

表 6-315 result 字段数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
code	No	Integer	Suggested HTTP return code for this status, 0 if not set.
details	No	details object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
message	No	String	A human-readable description of the status of this operation.
metadata	Yes	ListMeta object	Standard list metadata.
reason	No	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	No	String	Status of the operation. One of: "Success" or "Failure".

表 6-316 details 字段数据结构说明

参数	是否必选	参数类型	描述
causes	No	causes object	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	No	String	The group attribute of the resource associated with the status StatusReason.
kind	No	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind.
name	No	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	No	Integer	If specified, the time in seconds before the operation should be retried.
uid	No	String	UID of the resource. (when there is a single resource which can be described).

表 6-317 ListMeta 字段数据结构说明

参数	是否必选	参数类型	描述
resourceVersion	No	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only.

参数	是否必选	参数类型	描述
Continue	No	String	Continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response.
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.

表 6-318 causes 字段数据结构说明

参数	是否必选	参数类型	描述
field	No	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	No	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.

参数	是否必选	参数类型	描述
reason	No	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 6-319 ownerReferences 字段数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
kind	Yes	String	Kind of the referent.
name	Yes	String	Name of the referent.
uid	No	String	UID of the referent.
controller	No	Boolean	If true, this reference points to the managing controller.

表 6-320 volume 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.

参数	是否必选	参数类型	描述
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase.
metadata	Yes	metadata object	Standard object's metadata.
spec	Yes	spec object	Spec defines a specification of a volume owned by the cluster.
status	No	status object	Status represents the current information/status for the volume. Populated by the system. Read-only.

表 6-321 spec 字段数据结构说明

参数	是否必选	参数类型	描述
name	Yes	String	Name of this volume.
size	Yes	Integer	Size of this volume.
description	No	String	Description of this volume.
storageclassname	No	String	StorageClassName new add, use to get az and type from k8s.
inresourcepool	Yes	Boolean	是否在资源池中。
availability_zone	No	String	AvailabilityZone of this volume.
volume_type	No	String	VolumeType of this volume.
snapshot_id	No	String	SnapshotId of this volume.
multiattach	Yes	Boolean	Multiattach defines whether to attach by multiple containers.
storage_type	No	String	Optional values: BS(Block Storage), OS(Object Storage), NFS(Network File System).Default: BS
share_proto	No	String	When storage_type NFS is required, effective value is NFS.

参数	是否必选	参数类型	描述
is_public	No	Boolean	When storage_type is NFS, the visibility of sharing is expressed. Set to true, public visible, set to false, private visible. Default:false
access_to	No	String	When storage_type NFS is required, the definition of the access rule. The length of 1~255, is VPC ID.
access_level	No	String	When storage_type NFS is required, said sharing permission level to access the value of RO (read only), RW (read and write).
pvc_name	No	String	pvcName of volume
access	Yes	Array of access object	sfs access.
vpc_id	Yes	String	efs vpc
enterprise_project_id	No	String	enterprise_project_id
volume_id	No	String	volume_id
auto_expand	No	Boolean	When storage_type NFS is required, when value is true capacity expansion is not supported.

表 6-322 status 字段数据结构说明

参数	是否必选	参数类型	描述
id	No	String	A human-readable message indicating details about why the volume is in this state.
status	Yes	String	Phase indicates if a volume is available, bound to a claim, or released by a claim.
created_at	No	String	Reason is a brief CamelCase string that describes any failure and is meant for machine parsing and tidy display in the CLI.

参数	是否必选	参数类型	描述
attachments	Yes	Array of attachment objects	Attachments information of this volume.
app_info	Yes	Array of app_info objects	volume using info.
access_state	No	String	Access state
access_id	No	String	Vpc id
export_location	No	String	Export location
export_location s	No	String	Export locations

表 6-323 access 字段数据结构说明

参数	是否必选	参数类型	描述
share_id	No	String	uuid of share.
access_type	Yes	String	access rule type.
access_to	Yes	String	vpc id.
access_level	Yes	String	access level.
id	Yes	String	uuid of access rule.
state	Yes	String	status of access rule.should be active or error.

表 6-324 attachment 字段数据结构说明

参数	是否必选	参数类型	描述
attachment_id	No	String	AttachmentId.
server_id	No	String	Server of Attached device.
host_name	No	String	Host name of the attached machine.
device	No	String	Attached device.

表 6-325 app_info 字段数据结构说明

参数	是否必选	参数类型	描述
app_name	Yes	String	App name.
namespace	Yes	String	namespace.
mount_path	Yes	String	Mount path.
app_type	Yes	String	App type

7 权限和授权项

7.1 权限及授权项说明

如果您需要对您所拥有的云容器实例（CCI）进行精细的权限管理，您可以使用统一身份认证服务（Identity and Access Management，简称IAM），如果云账号已经能满足您的要求，不需要创建独立的IAM用户，您可以跳过本章节，不影响您使用CCI服务的其它功能。

默认情况下，新建的IAM用户没有任何权限，您需要将其加入用户组，并给用户组授予策略或角色，才能使用户组中的用户获得相应的权限，这一过程称为授权。授权后，用户就可以基于已有权限对云服务进行操作。关于策略的语法结构及示例，请参见[IAM权限管理说明](#)。

权限根据授权的精细程度，分为[角色](#)和[策略](#)。角色以服务为粒度，是IAM最初提供了一种根据用户的工作职能定义权限的粗粒度授权机制。策略以API接口为粒度进行权限拆分，授权更加精细，可以精确到某个操作、资源和条件，能够满足企业对权限最小化的安全管控要求。

说明

如果您要允许或是禁止某个接口的操作权限，请使用策略。

账号具备所有接口的调用权限，如果使用账号下的IAM用户发起API请求时，该IAM用户必须具备调用该接口所需的权限，否则，API请求将调用失败。每个接口所需要的权限，与各个接口所对应的授权项相对应，只有发起请求的用户被授予授权项所对应的策略，该用户才能成功调用该接口。例如，用户要调用接口来查询Pod，那么这个IAM用户被授予的策略中必须包含允许“CCI:namespaceSubResource:Get”的授权项，该接口才能调用成功。

支持的授权项

策略包含系统策略和自定义策略，如果系统策略不满足授权要求，管理员可以创建自定义策略，并通过给用户组授予自定义策略来进行精细的访问控制。策略支持的操作与API相对应，授权项列表说明如下：

- 权限：允许或拒绝某项操作。
- 对应API接口：自定义策略实际调用的API接口。

- 授权项：自定义策略中支持的Action，在自定义策略中的Action中写入授权项，可以实现授权项对应的权限功能。
- IAM项目(Project)/企业项目(Enterprise Project)：自定义策略的授权范围，包括IAM项目与企业项目。授权范围如果同时支持IAM项目和企业项目，表示此授权项对应的自定义策略，可以在IAM和企业管理两个服务中给用户组授权并生效。如果仅支持IAM项目，不支持企业项目，表示仅能在IAM中给用户组授权并生效，如果在企业管理中授权，则该自定义策略不生效。关于IAM项目与企业项目的区别，详情请参见：[IAM与企业管理的区别](#)。

📖 说明

“√”表示支持，“x”表示暂不支持。

云容器实例（CCI）支持的自定义策略授权项如下所示：

- **Namespace**，Namespace对象管理接口，包括Namespace对象的创建、查询、修改、删除等接口。
- **Pod**，Pod对象管理接口，包括Pod对象的查询接口。
- **Deployment**，Deployment对象管理接口，包括Deployment对象的创建、查询、修改、删除等接口。
- **StatefulSet**，Statefulset对象管理接口，包括Statefulset对象的创建、查询、修改、删除等接口。
- **Job**，Job对象管理接口，包括Job对象的创建、查询、修改、删除等接口。
- **Service**，Service对象管理接口，包括Service对象的创建、查询、修改、删除等接口。
- **Ingress**，Ingress对象管理接口，包括Ingress对象的创建、查询、修改、删除等接口。
- **Network**，Network对象管理接口，包括Network对象的创建、查询、删除等接口。
- **PersistentVolumeClaim**，PersistentVolumeClaim对象管理接口，包括PersistentVolumeClaim对象的创建、查询、修改、删除等接口。
- **ConfigMap**，Configmap对象管理接口，包括Configmap对象的创建、查询、修改、删除等接口。
- **Secret**，Secret对象管理接口，包括Secret对象的创建、查询、修改、删除等接口。
- **ClusterRole**，ClusterRole对象管理接口，包括ClusterRole的查询等接口。
- **RoleBinding**，RoleBinding对象管理接口，包括RoleBinding对象的创建、查询、修改、删除等接口。

7.2 授权项分类

表 7-1 Namespace

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建 Namespace	POST /api/v1/namespaces	CCI:namespace:create	√	√
查询 namespace	GET /api/v1/namespaces/{name}	CCI:namespace:get	√	√
列出 namespaces	GET /api/v1/namespaces	CCI:namespace:list	√	√
删除 namespace	DELETE /api/v1/namespaces/{name}	CCI:namespace:delete	√	√

表 7-2 Pod

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建Pod	POST /api/v1/namespaces/{namespace}/pods	CCI:namespaceSubResource:Create	√	√
查询Pod	GET /api/v1/namespaces/{namespace}/pods/{name}	CCI:namespaceSubResource:Get	√	√
查询指定 Namespace 下所有Pod	GET /api/v1/namespaces/{namespace}/pods	CCI:namespaceSubResource:List	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
查询Pod状态	GET /api/v1/namespaces/{namespace}/pods/{name}/status	CCI:namespaceSubResource:Get	√	√
查询Pod日志	GET /api/v1/namespaces/{namespace}/pods/{name}/log	CCI:namespaceSubResource:Get	√	√
列出用户所有的Pod	GET /api/v1/pods	cci:namespaceSubResource:List	√	√
替换Pod	PUT /api/v1/namespaces/{namespace}/pods/{name}	CCI:namespaceSubResource:Update	√	√
更新Pod	PATCH /api/v1/namespaces/{namespace}/pods/{name}	CCI:namespaceSubResource:Update	√	√
删除Pod	DELETE /api/v1/namespaces/{namespace}/pods/{name}	CCI:namespaceSubResource:Delete	√	√
删除所有Pod	DELETE /api/v1/namespaces/{namespace}/pods	CCI:namespaceSubResource:Delete	√	√

表 7-3 Deployment

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建 Deployment	POST /apis/apps/v1/namespaces/{namespace}/deployments	<ul style="list-style-type: none"> CCI:namespaceSubResource:Create elb:loadbalancers:create 	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
查询 Deployment	GET /apis/apps/v1/namespaces/{namespace}/deployments/{name}	CCI:namespaceSubResource:Get	√	√
查询 Namespace下所有 Deployment	GET /apis/apps/v1/namespaces/{namespace}/deployments	CCI:namespaceSubResource:List	√	√
查询 Deployment的状态	GET /apis/apps/v1/namespaces/{namespace}/deployments/{name}/status	CCI:namespaceSubResource:Get	√	√
查询 Deployment伸缩操作	GET /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale	CCI:namespaceSubResource:Get	√	√
列出用户所有的Deployment	GET /apis/apps/v1/deployments	CCI:namespaceSubResource:List	√	√
替换 Deployment	PUT /apis/apps/v1/namespaces/{namespace}/deployments/{name}	CCI:namespaceSubResource:Update	√	√
替换 Deployment伸缩操作	PUT /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale	CCI:namespaceSubResource:Update	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
更新 Deployment	PATCH /apis/ apps/v1/ namespaces/ {namespace}/ deployments/ {name}	CCI:namespaceS ubResource:Upda te	√	√
更新 Deployment伸 缩操作	PATCH /apis/ apps/v1/ namespaces/ {namespace}/ deployments/ {name}/scale	CCI:namespaceS ubResource:Upda te	√	√
删除 Deployment	DELETE /apis/ apps/v1/ namespaces/ {namespace}/ deployments/ {name}	CCI:namespaceS ubResource:Delet e	√	√
删除 Namespace下 所有 Deployment	DELETE /apis/ apps/v1/ namespaces/ {namespace}/ deployments	CCI:namespaceS ubResource:Delet e	√	√

表 7-4 StatefulSet

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建 StatefulSet	POST /apis/ apps/v1/ namespaces/ {namespace}/ statefulsets	<ul style="list-style-type: none"> CCI:namespace SubResource:Cr eate elb:loadbalanc ers:create 	√	√
查询 StatefulSet	GET /apis/apps/v1/ namespaces/ {namespace}/ statefulsets/ {name}	CCI:namespaceSu bResource:Get	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
查询指定 Namespace 下所有 StatefulSet	GET /apis/apps/v1/namespaces/{namespace}/statefulsets	CCI:namespaceSubResource:List	√	√
查询 StatefulSet 状态	GET /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}/status	CCI:namespaceSubResource:Get	√	√
列出用户所有的 Statefulset	GET /apis/apps/v1/statefulsets	CCI:namespaceSubResource:List	√	√
替换 StatefulSet	PUT /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}	CCI:namespaceSubResource:Update	√	√
更新 StatefulSet	PATCH /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}	CCI:namespaceSubResource:Update	√	√
删除 StatefulSet	DELETE /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}	CCI:namespaceSubResource>Delete	√	√
删除所有 StatefulSet	DELETE /apis/apps/v1/namespaces/{namespace}/statefulsets	CCI:namespaceSubResource>Delete	√	√

表 7-5 Job

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建Job	POST /apis/batch/v1/namespaces/{namespace}/jobs	<ul style="list-style-type: none"> CCI:namespaceSubResource:Create elb:loadbalancers:create 	√	√
查询Job	GET /apis/batch/v1/namespaces/{namespace}/jobs/{name}	CCI:namespaceSubResource:Get	√	√
查询指定Namespace下所有Job	GET /apis/batch/v1/namespaces/{namespace}/jobs	CCI:namespaceSubResource:List	√	√
查询Job状态	GET /apis/batch/v1/namespaces/{namespace}/jobs/{name}/status	CCI:namespaceSubResource:Get	√	√
列出用户所有Job	GET /apis/batch/v1/jobs	CCI:namespaceSubResource:List	√	√
替换Job	PUT /apis/batch/v1/namespaces/{namespace}/jobs/{name}	CCI:namespaceSubResource:Update	√	√
更新Job	PATCH /apis/batch/v1/namespaces/{namespace}/jobs/{name}	CCI:namespaceSubResource:Update	√	√
删除Job	DELETE /apis/batch/v1/namespaces/{namespace}/jobs/{name}	CCI:namespaceSubResource:Delete	√	√
删除所有Job	DELETE /apis/batch/v1/namespaces/{namespace}/jobs	CCI:namespaceSubResource:Delete	√	√

表 7-6 Service

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建Service	POST /api/v1/namespaces/{namespace}/services	<ul style="list-style-type: none"> CCI:namespaceSubResource:Create elb:loadbalancers:create 	√	√
查询Service	GET /api/v1/namespaces/{namespace}/services/{name}	CCI:namespaceSubResource:Get	√	√
查询所有Service	GET /api/v1/namespaces/{namespace}/services	CCI:namespaceSubResource:List	√	√
查询Service状态	GET /api/v1/namespaces/{namespace}/services/{name}/status	CCI:namespaceSubResource:Get	√	√
删除Service	DELETE /api/v1/namespaces/{namespace}/services/{name}	CCI:namespaceSubResource:Delete	√	√

表 7-7 Ingress

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建Ingress	POST /apis/extensions/v1beta1/namespaces/{namespace}/ingresses	<ul style="list-style-type: none"> CCI:namespaceSubResource:Create elb:loadbalancers:create 	√	√
查询Ingress	GET /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}	CCI:namespaceSubResource:Get	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
查询所有 Ingress	GET /apis/ extensions/v1beta1/ namespaces/ {namespace}/ ingresses	CCI:namespaceSubResource:List	√	√
查询 Ingress状态	GET /apis/ extensions/v1beta1/ namespaces/ {namespace}/ ingresses/{name}/ status	CCI:namespaceSubResource:Get	√	√
替换 Ingress	PUT /apis/ extensions/v1beta1/ namespaces/ {namespace}/ ingresses/{name}	CCI:namespaceSubResource:Update	√	√
更新 Ingress	PATCH /apis/ extensions/v1beta1/ namespaces/ {namespace}/ ingresses/{name}	CCI:namespaceSubResource:Update	√	√
删除 Ingress	DELETE /apis/ extensions/v1beta1/ namespaces/ {namespace}/ ingresses/{name}	CCI:namespaceSubResource>Delete	√	√
删除所有 Ingress	DELETE /apis/ extensions/v1beta1/ namespaces/ {namespace}/ ingresses	CCI:namespaceSubResource>Delete	√	√

表 7-8 Network

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建Network	POST /apis/networking.cci.io/v1beta1/namespaces/{namespace}/networks	<ul style="list-style-type: none"> • CCI:networkk:Create • vpc:vpcs:create • vpc:ports:create • vpc:vpcs:get • vpc:subnets:get • vpc:publicips:get • vpc:bandwidths:get • vpc:ports:get • vpc:peerings:get • vpc:quotas:list • vpc:privateips:get • vpc:securityGroups:get • vpc:securityGroupRules:get • vpc:networks:get • vpc:routers:get • vpc:floatingips:get • vpc:firewallRules:get 	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
查询Network	GET /apis/ networking.cci.io /v1beta1/ namespaces/ {namespace}/ networks/ {name}	CCI:network: Get	√	√
查询所有 Network	GET /apis/ networking.cci.io /v1beta1/ namespaces/ {namespace}/ networks	CCI:network:L ist	√	√
查询Network状 态	GET /apis/ networking.cci.io /v1beta1/ namespaces/ {namespace}/ networks/ {name}/status	CCI:network: Get	√	√
删除Network	DELETE /apis/ networking.cci.io /v1beta1/ namespaces/ {namespace}/ networks/ {name}	<ul style="list-style-type: none">• CCI:networ k:Delete• vpc:vpcs:de lete• vpc:ports:d elete	√	√
删除所有 Network对象	DELETE /apis/ networking.cci.io /v1beta1/ namespaces/ {namespace}/ networks	<ul style="list-style-type: none">• CCI:networ k:Delete• vpc:vpcs:de lete• vpc:ports:d elete	√	√

表 7-9 PersistentVolumeClaim

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建 PersistentVolumeClaim	POST /api/v1/namespaces/{namespace}/persistentvolumeclaims	<ul style="list-style-type: none"> • CCI:namespaceSubResource:Create - 云硬盘存储卷 evs:volumes:create evs:volumes:get evs:types:get - 文件存储卷 sfs:shares:createShare sfs:shares:getOSQuotaSets sfs:shares:ShareAction 	√	√
查询 PersistentVolumeClaim	GET /api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}	<ul style="list-style-type: none"> • CCI:namespaceSubResource:Get - 云硬盘存储卷 evs:volumes:get - 文件存储卷 sfs:shares:getAllSharesDetail 	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
查询所有 PersistentVolumeClaim	GET /api/v1/namespaces/{namespace}/persistentvolumeclaims	<ul style="list-style-type: none"> CCI:namespaceSubResource:List 云硬盘存储卷 evs:volume: list 文件存储卷 sfs:shares:getAllSharesDetail sfs:shares:ShareAction 对象存储卷 obs:bucket: ListAllMyBuckets 	√	√
删除 PersistentVolumeClaim	DELETE /api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}	<ul style="list-style-type: none"> CCI:namespaceSubResource:Delete 云硬盘存储卷 evs:volume: delete evs:volume: get 文件存储卷 sfs:shares:deleteShare 	√	√

表 7-10 ConfigMap

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建ConfigMap	POST /api/v1/namespaces/{namespace}/configmaps	CCI:namespaceSubResource:Create	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
查询ConfigMap	GET /api/v1/namespaces/{namespace}/configmaps/{name}	CCI:namespaceSubResource:Get	√	√
查询所有ConfigMap	GET /api/v1/namespaces/{namespace}/configmaps	CCI:namespaceSubResource:List	√	√
替换ConfigMap	PUT /api/v1/namespaces/{namespace}/configmaps/{name}	CCI:namespaceSubResource:Update	√	√
更新ConfigMap	PATCH /api/v1/namespaces/{namespace}/configmaps/{name}	CCI:namespaceSubResource:Update	√	√
删除ConfigMap	DELETE /api/v1/namespaces/{namespace}/configmaps/{name}	CCI:namespaceSubResource:Delete	√	√
删除所有ConfigMap	DELETE /api/v1/namespaces/{namespace}/configmaps	CCI:namespaceSubResource:Delete	√	√

表 7-11 Secret

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建Secret	POST /api/v1/namespaces/{namespace}/secrets	CCI:namespaceSubResource:Create	√	√
替换Secret	PUT /api/v1/namespaces/{namespace}/secrets/{name}	CCI:namespaceSubResource:Update	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
更新Secret	PATCH /api/v1/namespaces/{namespace}/secrets/{name}	CCl:namespaceSubResource:Update	√	√
删除Secret	DELETE /api/v1/namespaces/{namespace}/secrets/{name}	CCl:namespaceSubResource:Delete	√	√
删除所有Secret	DELETE /api/v1/namespaces/{namespace}/secrets	CCl:namespaceSubResource:Delete	√	√

表 7-12 ClusterRole

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
获取指定的ClusterRole	GET /apis/rbac.authorization.k8s.io/v1/clusterroles/{name}	CCl:rbac:Get	√	√
获取ClusterRole列表	GET /apis/rbac.authorization.k8s.io/v1/clusterroles	CCl:rbac:List	√	√

表 7-13 RoleBinding

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
创建RoleBinding	POST /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings	CCl:rbac:Create	√	√

权限	对应API接口	授权项	IAM项目 (Project)	企业项目 (Enterprise Project)
更新指定的 RoleBinding	PATCH /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}	CCI:rbac:Update	√	√
替换指定的 RoleBinding	PUT /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}	CCI:rbac:Update	√	√
删除指定的 RoleBinding	DELETE /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}	CCI:rbac:Delete	√	√
获取指定的 RoleBinding	GET /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}	CCI:rbac:Get	√	√
获取指定 namespace 下 RoleBinding 列表	GET /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings	CCI:rbac:List	√	√
获取 RoleBinding 列表	GET /apis/rbac.authorization.k8s.io/v1/rolebindings	CCI:rbac:List	√	√

8 附录

8.1 PATCH 请求方法操作说明

对于PATCH请求方法的操作，Kubernetes API通过相应的HTTP头域“Content-Type”对其进行识别。

操作说明

目前支持两种类型的PATCH请求方法的操作。

1. Merge Patch, Content-Type: application/merge-patch+json

在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。

2. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json

Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

“Merge Patch”与“Strategic Merge Patch”的操作区别请参见[PATCH请求方法操作示例](#)。

8.2 PATCH 请求方法操作示例

本章节主要介绍PATCH请求方法中，“Merge Patch”与“Strategic Merge Patch”类型的操作示例。

操作示例

以创建Deployment资源对象为例。

请求示例

```
{  
  "apiVersion": "v1",  
  "kind": "Deployment",
```

```
"metadata": {
  "name": "nginx"
},
"spec": {
  "replicas": 2,
  "selector": {
    "app": "nginx"
  },
  "template": {
    "metadata": {
      "labels": {
        "app": "nginx"
      }
    },
    "spec": {
      "containers": [
        {
          "name": "redis",
          "image": "redis:latest",
          "ports": [
            {
              "containerPort": 80
            }
          ]
        }
      ]
    }
  }
}
}
```

响应示例

```
{
  "kind": "ReplicationController",
  "apiVersion": "v1",
  "metadata": {
    "name": "frontend-controller",
    "namespace": "default",
    "selfLink": "/api/v1/namespaces/default/replicationcontrollers/nginx-controller",
    "uid": "549b2234-5d46-11e6-aeb9-286ed488fafa",
    "resourceVersion": "4110",
    "generation": 1,
    "creationTimestamp": "2016-08-08T08:58:52Z",
    "labels": {
      "app": "nginx"
    }
  },
  "spec": {
    "replicas": 2,
    "selector": {
      "app": "nginx"
    },
    "template": {
      "metadata": {
        "creationTimestamp": null,
        "labels": {
          "app": "nginx"
        }
      },
      "spec": {
        "containers": [
          {
            "name": "redis",
            "image": "redis:latest",
            "ports": [
              {
                "containerPort": 80,
                "protocol": "TCP"
              }
            ]
          }
        ]
      }
    }
  }
}
```

```
    ],
    "resources": {},
    "terminationMessagePath": "/dev/termination-log",
    "imagePullPolicy": "Always"
  }
],
"restartPolicy": "Always",
"dnsPolicy": "ClusterFirst",
"securityContext": {}
}
}
},
"status": {
  "replicas": 0
}
}
```

- 如果使用“Merge Patch”类型操作，添加一个容器到指定Deployment的“template”参数中，则其中的整个容器列表将被新添加的容器所替换。

Merge Patch请求

```
{
  "spec": {
    "template": {
      "spec": {
        "containers": [
          {
            "name": "hello-world",
            "image": "busybox:latest"
          }
        ]
      }
    }
  }
}
```

Merge Patch响应

```
{
  "kind": "ReplicationController",
  "apiVersion": "v1",
  "metadata": {
    "name": "frontend-controller",
    "namespace": "default",
    "selfLink": "/api/v1/namespaces/default/replicationcontrollers/nginx-controller",
    "uid": "549b2234-5d46-11e6-aeb9-286ed488fafa",
    "resourceVersion": "4159",
    "generation": 2,
    "creationTimestamp": "2016-08-08T08:58:52Z",
    "labels": {
      "app": "nginx"
    }
  },
  "spec": {
    "replicas": 2,
    "selector": {
      "app": "nginx"
    },
    "template": {
      "metadata": {
        "creationTimestamp": null,
        "labels": {
          "app": "nginx"
        }
      },
      "spec": {
        "containers": [
          {
            "name": "hello-world",
            "image": "busybox:latest",
            "resources": {},

```

```
        "terminationMessagePath": "/dev/termination-log",
        "imagePullPolicy": "Always"
      }
    ],
    "restartPolicy": "Always",
    "dnsPolicy": "ClusterFirst",
    "securityContext": {}
  }
},
"status": {
  "replicas": 2,
  "fullyLabeledReplicas": 2,
  "observedGeneration": 1
}
}
```

其中“containers”参数列表被新添加的内容所替换。

- 而使用“Strategic Merge Patch”类型操作，是添加元数据到资源对象中，并通过这些新元数据来决定各个列表是否需要被合并。

Strategic Merge Patch请求

```
{
  "spec": {
    "template": {
      "spec": {
        "containers": [
          {
            "name": "hello-world",
            "image": "busybox:latest"
          }
        ]
      }
    }
  }
}
```

Strategic Merge Patch响应

```
{
  "kind": "ReplicationController",
  "apiVersion": "v1",
  "metadata": {
    "name": "frontend-controller",
    "namespace": "default",
    "selfLink": "/api/v1/namespaces/default/replicationcontrollers/nginx-controller",
    "uid": "f2e048bb-5d46-11e6-aeb9-286ed488fafa",
    "resourceVersion": "4250",
    "generation": 2,
    "creationTimestamp": "2016-08-08T09:03:18Z",
    "labels": {
      "app": "nginx"
    }
  },
  "spec": {
    "replicas": 2,
    "selector": {
      "app": "nginx"
    },
    "template": {
      "metadata": {
        "creationTimestamp": null,
        "labels": {
          "app": "nginx"
        }
      },
      "spec": {
        "containers": [
          {
            "name": "redis",
```

```
        "image": "redis:latest",
        "ports": [
          {
            "containerPort": 80,
            "protocol": "TCP"
          }
        ],
        "resources": {},
        "terminationMessagePath": "/dev/termination-log",
        "imagePullPolicy": "Always"
      },
      {
        "name": "hello-world",
        "image": "busybox:latest",
        "resources": {},
        "terminationMessagePath": "/dev/termination-log",
        "imagePullPolicy": "Always"
      }
    ],
    "restartPolicy": "Always",
    "dnsPolicy": "ClusterFirst",
    "securityContext": {}
  }
},
"status": {
  "replicas": 2,
  "fullyLabeledReplicas": 2,
  "observedGeneration": 1
}
```

其中“containers”参数列表与新添加的内容合并，而不是替换，合并的依据为“name”域的值。

8.3 约束限制

区域

云容器实例当前支持的区域，如表8-1所示。

表 8-1 支持的区域

区域名称	区域
拉美-圣保罗一	sa-brazil-1

Pod 规格

当不使用GPU时，Pod规格需满足如下要求：

- Pod的CPU取值范围为0.25核-32核，或者自定义选择48核、64核，且单个容器的CPU必须为0.25核的整数倍
- Pod的内存取值范围为1GB-512GB，且内存必须为1GB的整数倍
- Pod的CPU/内存配比值必须在1:2到1:8之间
- 一个Pod内最多支持5个容器，单个容器最小配置是0.25核、0.2GB，最大同容器实例的最大配置

- Pod中所有容器和InitContainer（启动容器）规格中的request和limit相等
详情请参见[Pod规格计算方式](#)。

Pod 存储空间

如果没有挂载EVS等磁盘，应用数据存储在不容器的物理机磁盘，每个Pod存储空间限制为CPU物理机磁盘为20G，GPU物理机磁盘为20G。

配额

云容器实例对单个用户的资源数量和容量限定了配额，配额的详细信息请参见[关于配额](#)。

Pod 规格计算方式

Pod规格的计算方式遵循如下规则：

- 步骤1** Pod包含的所有InitContainer上定义的任何特定资源的约束值 (limit) 或请求值 (request) 的最大值，作为Pod有效初始request/limit。
- 步骤2** Pod对资源的有效limit/request，是取如下两项的较大者：
 - 所有应用容器对某个资源的limit/request之和；
 - 对某个资源的有效初始的limit/request。

----结束

说明

InitContainer是一种特殊容器，在 Pod 内的应用容器启动之前运行。有关InitContainer更多解释请参见[对容器进行初始化操作](#)。

8.4 Namespace 和 Network

Namespace（命名空间）是一种在多个用户之间划分资源的方法。适用于用户中存在多个团队或项目的情况。当前云容器实例提供“通用计算型”类型的资源，创建命名空间时需要选择资源类型，后续创建的负载中容器就运行在此类型的集群上。

- 通用计算型**：支持创建含CPU资源的容器实例及工作负载，适用于通用计算场景。

Network是云容器实例扩展的一种Kubernetes资源对象，用于关联VPC及子网，从而使得容器实例能够使用公有云的网络资源。

Namespace 与网络的关系

从网络角度看，命名空间对应一个虚拟私有云（VPC）中一个子网，如[图8-1](#)所示，在创建命名空间时会关联已有VPC或创建一个新的VPC，并在VPC下创建一个子网。后续在该命名空间下创建Pod、Service等资源时都会在对应的VPC及子网之内，且占用子网中的IP地址。

通常情况下，如果您在同一个VPC下还会使用其他服务的资源，您需要考虑您的网络规划，如子网网段划分、IP数量规划等，确保有可用的网络资源。

图 8-1 命名空间与 VPC 子网的关系

哪些情况下适合使用多个命名空间

因为Namespace可以实现部分的环境隔离，当您的项目和人员众多的时候可以考虑根据项目属性，例如生产、测试、开发划分不同的Namespace。

创建 Namespace

Namespace下需要有一个Network关联VPC及子网，创建完Namespace后需要创建一个Network。

说明

通常情况下，没有频繁创建Namespace的需求，建议通过云容器实例的控制台界面创建Namespace，具体方法请参见[创建命名空间](#)。

以下示例创建一个名为namespace-test的Namespace，指定云容器实例的资源类型为general-computing。

```
apiVersion: v1
kind: Namespace
metadata:
  name: namespace-test
  labels:
    sys_enterprise_project_id: "0"
  annotations:
    namespace.kubernetes.io/flavor: general-computing
spec:
  finalizers:
    - kubernetes
```

这里的定义文件采用YAML格式描述（如果您对YAML格式不了解，可以参考[YAML语法](#)），也是使用JSON格式。

- `sys_enterprise_project_id`：表示企业项目ID，可进入[企业管理](#)的企业项目详情页面获取。未开通企业管理的用户无需配置此参数。不配置时默认为0，表示default企业项目。
- `namespace.kubernetes.io/flavor: general-computing`：指定命名空间类型。命名空间的类型有如下两种：
 - **general-computing**：通用计算型，支持创建含CPU资源的容器实例及工作负载，适用于通用计算场景。
 - **gpu-accelerated**：GPU型，支持创建含GPU资源的容器实例及工作负载，适用于深度学习、科学计算、视频处理等场景。

假如上面Namespace定义的文件名称为ns.yaml，则执行kubect create -f ns.yaml即可创建命名空间，-f 表示从文件创建。

```
# kubectl create -f ns.yaml
namespace/namespace-test created
```

执行kubectl get ns查询namespace是否创建成功，ns为namespace的缩写。

```
# kubectl get ns
NAME          STATUS   AGE
namespace-test Active   23s
```

如上，可以看到namespace-test这个命名空间创建成功，且存在的时长为23秒。

登录云容器实例控制台，单击左侧导航栏“命名空间”，您可以看到命名空间创建成功，但状态为“异常”。这是因为在云容器实例中，您需要为Namespace定义网络策略，具体操作方法请参见[创建Network](#)。

图 8-2 Namespace-异常

名称	类型	状态
namespace-test	通用计算型	 异常

创建 Network

Namespace创建好后，需要为Namespace创建网络策略，关联VPC及子网。

以下示例创建一个名为test-network的Network。

```
apiVersion: networking.cci.io/v1beta1
kind: Network
metadata:
  annotations:
    network.alpha.kubernetes.io/default-security-group: security-group-id
    network.alpha.kubernetes.io/domain-id: domain-id
    network.alpha.kubernetes.io/project-id: project-id
  name: test-network
spec:
  cidr: 192.168.0.0/24
  attachedVPC: vpc-id
  networkID: network-id
  networkType: underlay_neutron
  subnetID: subnet-id
```

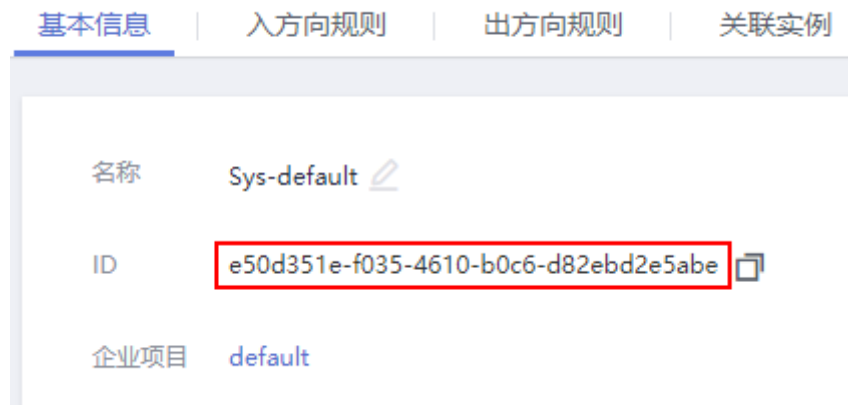

📖 说明

此处VPC和子网的网段不能为10.247.0.0/16，10.247.0.0/16是云容器实例预留给Service的网段。如果您使用此网段，后续可能会造成IP冲突，导致负载无法创建或服务不可用；如果您不需要通过Service访问，而是直接访问Pod，则可以使用此网段。

上面参数获取方法如下：

- network.alpha.kubernetes.io/domain-id：账号ID，可以在[我的凭证](#)获取。
- network.alpha.kubernetes.io/project-id：项目ID，可以在[我的凭证](#)获取。
- network.alpha.kubernetes.io/default-security-group：安全组ID，可以在[安全组控制台](#)获取，如下图。

图 8-3 获取安全组 ID

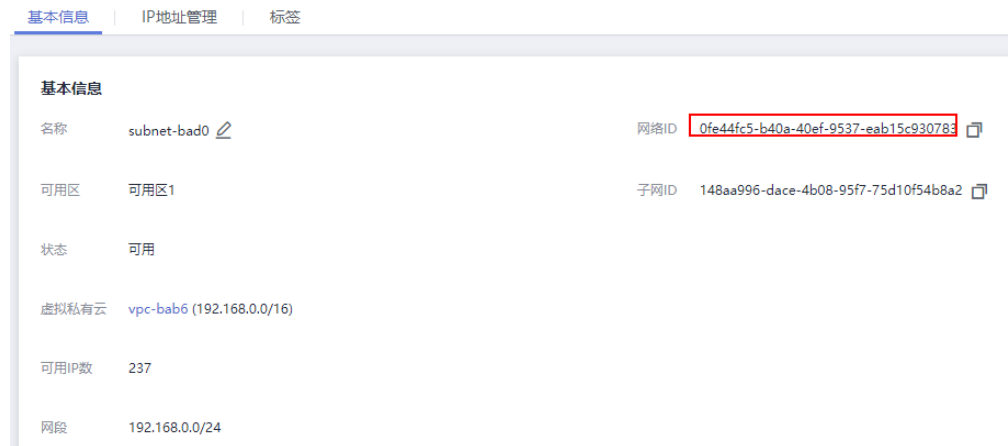

- cidr: 子网网段。
- attachedVPC: 虚拟私有云的ID, 可在VPC控制台获取。

图 8-4 获取 VPC ID

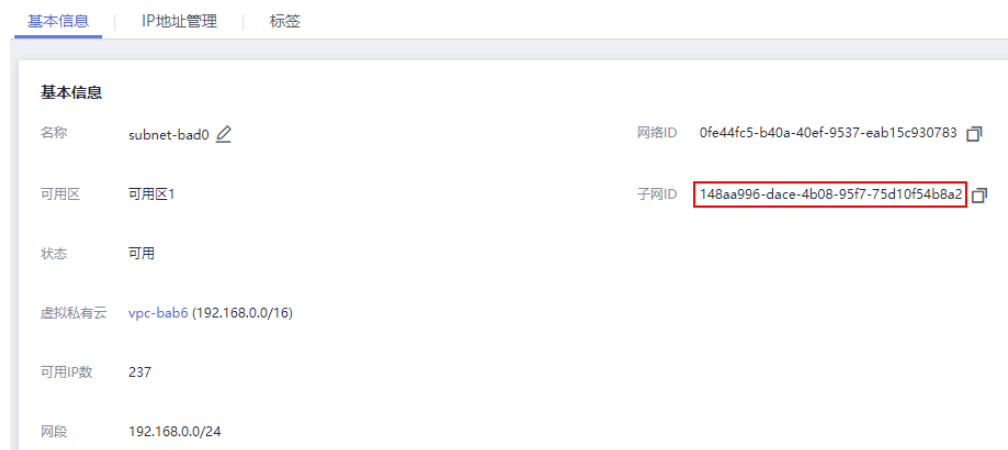

- networkID: 子网的网络ID, 可在VPC控制台 > 子网中获取。

图 8-5 获取子网的网络 ID

- networkType: 网络类型，当前仅支持underlay_neutron网络模式。
- subnetID: 子网ID，可在VPC控制台 > 子网获取。

图 8-6 获取子网 ID

假如上面Network定义的文件名称为network.yaml，则执行kubect create -f network.yaml即可创建命名空间，-f 表示从文件创建。这里--namespace namespace-test是指定在namespace-test这个命名空间下创建。

```
# kubectl create -f network.yaml --namespace namespace-test
network.networking.cci.io/test-network created
```

登录云容器实例控制台，单击左侧导航栏“命名空间”，您可以看到命名空间创建成功，且状态为“正常”。

图 8-7 Namespace-正常

名称	类型	状态
namespace-test	通用计算型	正常

为 kubectl 上下文指定 Namespace

上面创建Network是在指定的Namespace下创建的，本文档后续的资源创建都是在某个命名空间下操作，每次都指定命名空间比较麻烦，您可以为kubectl上下文指定命名空间，这样在某个上下文中，创建的资源就都是在某个命名空间下，方便操作。

指定Namespace只需要在设置上下文命令中添加一个“--namespace”选项，如下所示。

```
kubectl config set-context $context --namespace=$ns
```

其中，*\$ns*为Namespace的名称；*\$context*为上下文的名称，可以自定义，也可执行如下命令获取：

```
# kubectl config get-contexts
CURRENT_NAME          CLUSTER          AUTHINFO
NAMESPACE
  cci-context-cn-east-3-1C8PNI0POPPCSFGXPM6S  cci-cluster-cn-east-3  cci-user-cn-east-3-1C8PNI0POPPCSFGXPM6S
* cci-context-cn-east-3-hwuser_xxx            cci-cluster-cn-east-3  cci-user-cn-east-3-hwuser_xxx
  kubernetes-admin@kubernetes                kubernetes            kubernetes-admin
```

假设，上面创建的Namespace名称为namespace-test，则示例如下。

```
# kubectl config set-context cci-context --namespace=namespace-test
```

指定Namespace后，就可以使用 kubectl 命令直接操作云容器实例的相关资源。如下所示，执行**kubectl get pod**，查看Pod资源，一切正常。

```
# kubectl get pod
No resources found.
```

8.5 状态码

状态码	编码	状态说明
100	Continue	继续请求。 这个临时响应用来通知客户端，它的部分请求已经被服务器接收，且仍未被拒绝。
101	Switching Protocols	切换协议。只能切换到更高级的协议。 例如，切换到HTTP的新版本协议。
200	OK	GET、PUT、POST操作正常返回。
201	Created	创建类的请求完全成功。
202	Accepted	已经接受请求，但未处理完成。
203	Non-Authoritative Information	非授权信息，请求成功。
204	NoContent	请求完全成功，同时HTTP响应不包含响应体。 在响应OPTIONS方法的HTTP请求时返回此状态码。
205	Reset Content	重置内容，服务器处理成功。

状态码	编码	状态说明
206	Partial Content	服务器成功处理了部分GET请求。
300	Multiple Choices	多种选择。请求的资源可包括多个位置，相应可返回一个资源特征与地址的列表用于用户终端（例如：浏览器）选择。
301	Moved Permanently	永久移动，请求的资源已被永久的移动到新的URI，返回信息会包括新的URI。
302	Found	资源被临时移动。
303	See Other	查看其它地址。 使用GET和POST请求查看。
304	Not Modified	所请求的资源未修改，服务器返回此状态码时，不会返回任何资源。
305	Use Proxy	所请求的资源必须通过代理访问。
306	Unused	已经被废弃的HTTP状态码。
400	BadRequest	非法请求。 建议直接修改该请求，不要重试该请求。
401	Unauthorized	在客户端提供认证信息后，返回该状态码，表明服务端指出客户端所提供的认证信息不正确或非法。
402	Payment Required	保留请求。
403	Forbidden	请求被拒绝访问。 返回该状态码，表明请求能够到达服务端，且服务端能够理解用户请求，但是拒绝做更多的事情，因为该请求被设置为拒绝访问，建议直接修改该请求，不要重试该请求。
404	NotFound	所请求的资源不存在。 建议直接修改该请求，不要重试该请求。
405	MethodNotAllowed	请求中带有该资源不支持的方法。 建议直接修改该请求，不要重试该请求。
406	Not Acceptable	服务器无法根据客户端请求的内容特性完成请求。
407	Proxy Authentication Required	请求要求代理的身份认证，与401类似，但请求者应当使用代理进行授权。
408	Request Time-out	服务器等候请求时发生超时。 客户端可以随时再次提交该请求而无需进行任何更改。

状态码	编码	状态说明
409	Conflict	服务器在完成请求时发生冲突。 返回该状态码，表明客户端尝试创建的资源已经存在，或者由于冲突请求的更新操作不能被完成。
410	Gone	客户端请求的资源已经不存在。 返回该状态码，表明请求的资源已被永久删除。
411	Length Required	服务器无法处理客户端发送的不带Content-Length的请求信息。
412	Precondition Failed	未满足前提条件，服务器未满足请求者在请求中设置的其中一个前提条件。
413	Request Entity Too Large	由于请求的实体过大，服务器无法处理，因此拒绝请求。为防止客户端的连续请求，服务器可能会关闭连接。如果只是服务器暂时无法处理，则会包含一个Retry-After的响应信息。
414	Request-URI Too Large	请求的URI过长（URI通常为网址），服务器无法处理。
415	Unsupported Media Type	服务器无法处理请求附带的媒体格式。
416	Requested range not satisfiable	客户端请求的范围无效。
417	Expectation Failed	服务器无法满足Expect的请求头信息。
422	Unprocessable Entity	请求格式正确，但是由于含有语义错误，无法响应。
429	TooManyRequests	表明请求超出了客户端访问频率的限制或者服务端接收到多于它能处理的请求。建议客户端读取相应的Retry-After首部，然后等待该首部指出的时间后再重试。
500	InternalServerError	表明服务端能被请求访问到，但是不能理解用户的请求。
501	Not Implemented	服务器不支持请求的功能，无法完成请求。
502	Bad Gateway	充当网关或代理的服务器，从远端服务器接收到了一个无效的请求。
503	ServiceUnavailable	被请求的服务无效。 建议直接修改该请求，不要重试该请求。
504	ServerTimeout	请求在给定的时间内无法完成。客户端仅在为请求指定超时（Timeout）参数时会得到该响应。
505	HTTP Version not supported	服务器不支持请求的HTTP协议的版本，无法完成处理。

8.6 错误码

调用接口出错后，将不会返回结果数据。调用方可根据每个接口对应的错误码来定位错误原因。当调用出错时，HTTP请求返回一个 4xx 或 5xx 的HTTP状态码。返回的消息体中是具体的错误代码及错误信息。在调用方找不到错误原因时，可以联系华为云客服，并提供错误码，以便我们尽快帮您解决问题。

错误响应 Body 体格式说明

当接口调用出错时，会返回错误码及错误信息说明，错误响应的Body体格式如下所示。

```
{
  "kind": "Status",
  "apiVersion": "v1",
  "metadata": {},
  "status": "Failure",
  "message": "namespace name is already exist",
  "reason": "Conflict",
  "code": 409,
  "errorCode": "CCI.02.409101"
}
```

其中，code表示HTTP状态码，errorCode表示错误码，message表示错误描述信息。

错误码说明

当您使用云容器实例的API时，如果遇到“APIGW”开头的错误码，请参见[API网关错误码](#)进行处理。

状态码	错误码	错误信息	描述	处理措施
400	CCI.01.400101	request body error	请求错误: 请求体不合法	按接口文档排查请求体
400	CCI.01.400102	provide namespace request ed	查询 namespace 详情失败: 未指定待查询的 namespace	请指定待查询的namespace，请修改后重试
400	CCI.01.400103	missing user token in the request header	创建网络失败: 请求头未携带最终用户的 token:X-User-Token	请求头携带最终用户的token:X-User-Token

状态码	错误码	错误信息	描述	处理措施
400	CCI.01.400104	no agency quota found from iam, please enlarge your quota	委托配额不足, 请到配额中心申请调整配额	请到配额中心申请调整配额
400	CCI.01.400105	must specify namespace name through fieldSelector, example: fieldSelector=metadata.name=namespaceName	必须通过fieldSelector来指定namespace名称, 例如: fieldSelector=metadata.name=namespaceName	请通过fieldSelector来指定namespace名称
400	CCI.01.400106	volume import:request body error	卷导入接口的请求体不合法	按卷导入接口文档排查请求体
400	CCI.01.400107	enterprise id not valid	企业项目id不合法	企业项目id不合法, 请修改后重试

状态码	错误码	错误信息	描述	处理措施
400	CCI.01.400201	subnet cidr subnet invalid : within the coverage of VPC, and no more subnets overlap	子网cidr非法: 在vpc的覆盖范围内, 和其他的子网重叠	修改子网网段, 不与其他子网重叠
400	CCI.01.400202	project id in network request body invalid	创建网络失败: 请求体的 Annotation 中未携带 project_id	请求体的Annotation中需携带project_id, 请修改后重试
400	CCI.01.400301	storage type parameter invalid : nfs/obs/bs	存储类型参数错误, 当前支持的存储类型有:nfs、obs和bs	存储类型参数错误, 请修改后重试

状态码	错误码	错误信息	描述	处理措施
400	CCI.01.400302	storage volume id format invalid: the beginning and end of a numeric letter, which may contain an underline in the middle of the numeric letter	存储卷id格式非法: 数字字母的开头和结尾, 数字字母的中间可以包含下划线	请修改存储卷id格式后重试
400	CCI.01.400303	storage volume id len invalid : no bigger than 64	存储卷id长度非法: 最大长度为64	存储卷id长度最大为64, 请修改后重试
400	CCI.01.400304	storage request body invalid	释放存储卷失败: delete_volume字段不合法	请修改delete_volume字段后重试
400	CCI.01.400305	storage volume not available	导入存储卷失败: 存储卷状态异常	联系技术支持排查存储卷问题后重试
400	CCI.01.400306	storage volume is not found	导入存储卷失败: 指定的存储卷不存在	请确定导入的存储卷存在后尝试

状态码	错误码	错误信息	描述	处理措施
400	CCI.01.400307	nfs storage class type err,use "nfs-rw"	导入存储卷失败：指定的nfs存储的storageclass不支持，当前支持：nfs-rw	请导入nfs-rw
400	CCI.01.400308	storage volume type err ,available: sas/ssd/sata	导入存储卷失败：存储规格不支持，支持的规格为:sas、ssd和sata	请导入支持的存储格式，如sas、ssd和sata
400	CCI.01.400309	storage volume already provisioned	导入存储卷失败：当前卷已经被导入	请确认当前卷是否已经被导入
400	CCI.01.400401	invalid billing request body: unsupported billing status	billing接口失败：不支持的status字段	请修改支持的status字段
400	CCI.01.400402	invalid billing request body: unsupported billing resource type	billing接口失败：不支持的resource type字段	请修改支持的resource type字段

状态码	错误码	错误信息	描述	处理措施
400	CCI.01.400403	invalid billing request user: inner user can not be freeze or unfreeze	billing接口失败: 不支持操作内部租户	修改user为非内部用户
400	CCI.01.400404	invalid billing request body: resource infos can not match scene	billing接口失败: 不支持的scene字段	请修改支持的scene字段
500	CCI.01.500101	find no cluster endpoint for namespace xxx from icluster response header	通过 namespace 查询集群地址失败	联系技术支持解决
403	CCI.01.403009	your account is in arrears, please recharge	请求错误: 账户欠费	请先给账户充值
403	CCI.01.403101	only gpu beta users can use gpu in cci	请求出错: 未申请GPU公测	请先申请GPU公测

状态码	错误码	错误信息	描述	处理措施
403	CCI.01.403102	only obs beta users can use obs in cci	请求出错：未申请OBS公测	请先申请OBS公测
403	CCI.01.403103	user's token can not match auth token for resourceUser's	鉴权出错：token中domain与请求domain不匹配	请确认token中domain与请求domain相匹配
403	CCI.01.403104	current user has no right	鉴权出错：用户无权限进行当前操作	用户无权限进行当前操作，请确认当前用户是否有操作权限
403	CCI.01.403105	insufficient operation permission, require cci:namespace:create	创建命名空间失败，您可能没有cci:namespace:create权限	请向管理员申请namespace create权限
403	CCI.01.403106	insufficient operation permission, require cci:namespace:delete	删除命名空间失败，您可能没有cci:namespace:delete权限	请向管理员申请namespace delete权限

状态码	错误码	错误信息	描述	处理措施
403	CCI.01.403107	insufficient operation permission, require cci:namespace:update	更新命名空间失败, 您可能没有 cci:namespace:update 权限	请向管理员申请 namespace update 权限
403	CCI.01.403108	insufficient operation permission, require cci:namespace:get	获取命名空间失败, 您可能没有 cci:namespace:get 权限	请向管理员申请 namespace get 权限
403	CCI.01.403109	insufficient operation permission, require cci:namespace:list	获取命名空间列表失败, 您可能没有 cci:namespace:list 权限	请向管理员申请 namespace list 权限
403	CCI.01.403110	insufficient operation permission, require cci:namespaceSubResource:create	创建资源失败, 您可能没有 cci:namespaceSubResource:create 权限	请向管理员申请 namespaceSubResource create 权限

状态码	错误码	错误信息	描述	处理措施
403	CCI.01.40311	insufficient operation permission, require cci:namespaceSubResource:delete	删除资源失败, 您可能没有 cci:namespaceSubResource:delete 权限	请向管理员申请 namespaceSubResource delete 权限
403	CCI.01.40312	insufficient operation permission, require cci:namespaceSubResource:update	更新资源失败, 您可能没有 cci:namespaceSubResource:update 权限	请向管理员申请 namespaceSubResource update 权限
403	CCI.01.40313	insufficient operation permission, require cci:namespaceSubResource:get	获取资源失败, 您可能没有 cci:namespaceSubResource:get 权限	请向管理员申请 namespaceSubResource get 权限
403	CCI.01.40314	insufficient operation permission, require cci:namespaceSubResource:list	获取资源列表失败, 您可能没有 cci:namespaceSubResource:list 权限	请向管理员申请 namespaceSubResource list 权限

状态码	错误码	错误信息	描述	处理措施
404	CCI.01.404101	no agency found for user	请求出错：查找的授信关系不存在	请登录前端界面，选到对应region的CCI服务，点击“服务授权”中“同意授权”，CCI将创建委托
401	CCI.01.401102	user has no agency to cci, please apply a agency to cci	请求失败，请先授信CCI服务	请先授信CCI服务
403	CCI.04.403112	Chart must have same name and version with original chart	更新模板失败：模板版本和名称必须与原始模板一致	请确保模板版本和名称必须与原始模板一致
403	CCI.04.403124	The official charts is forbidden to be downloaded	下载模板错误：官方模板禁止下载	请联系技术支持
403	CCI.04.403125	Chart is used, can't deleted	模板删除失败：有应用使用了该模板	请联系技术支持
403	CCI.04.403126	The chart is deprecated, please select a higher version	当前选择的模板版本已废弃，请选择更新的版本	请选择更新的版本

状态码	错误码	错误信息	描述	处理措施
403	CCI.04.403129	Only addon charts have readme.md now, the target chart is not an addon chart	操作失败，readme.md 关联的不是插件模板	请关联插件模板
403	CCI.04.403130	Not allowed to update chart belong to other tenant	请求失败：禁止操作其他用户的模板	禁止操作其他用户的模板
403	CCI.04.403131	Update release is forbidden:The status of release is not DEPLOYED or FAILED	更新失败：当前应用状态不支持更新，安装成功/失败的应用支持更新	请联系技术支持

状态码	错误码	错误信息	描述	处理措施
400	CCI.04.400104	Validate chart version failed	请求失败：模板版本不合法，版本格式要求：长度不大于64位且需满足SemVer语义化版本控制规范。正确示例：1.0.0、1.0.0-alpha、1.0.0-alpha+001	请提供符合版本格式要求的模板版本
400	CCI.04.400105	the ID should not be empty	模板ID不能为空	请输入正确的模板ID
400	CCI.04.400111	Only addon allowed	请求失败：该请求只支持插件模板	请提供插件模板
400	CCI.04.400112	the length of ID is more than 64	请求失败：模板ID长度超过最大64位限制	请输入正确的模板ID
400	CCI.04.400113	Chart ID format is Invalid, must match the regex	请求失败：模板ID格式出错	请输入正确的模板ID
400	CCI.04.400118	Validate chart failed	请求失败：模板文件格式错误，文件后缀名必须是"tgz"，默认最大长度为2兆	请提供文件后缀名是"tgz"，默认长度为2兆内的模板文件

状态码	错误码	错误信息	描述	处理措施
400	CCI.04.400119	Chart file not found	请求失败: 模板文件内容为空	请提供内容不为空的模板文件
400	CCI.04.400121	Chart format is invalid, Chart package name and version must be same with chart name and version	模板包格式错误, 模板包名称和版本必须与模板名称和版本一致	请提供模板包名称和版本与模板名称和版本一致的模板包
400	CCI.04.400126	No target version selected, select one please	请求失败: 未指定插件版本	请指定插件版本
400	CCI.04.400131	Unsupported language	删除readme文件出错: 请求参数的语言模式不正确, 当前仅支持中文和英文	请确保readme文件的语言模式为中文或英文
400	CCI.04.400201	Invalid release name	请求失败: 实例名称不能为空	请输入正确的实例名称
400	CCI.04.400202	Release name length error	请求失败: 实例名长度超过24限制	请输入正确的实例名称

状态码	错误码	错误信息	描述	处理措施
400	CCI.04.400203	Release name not match regex	请求失败：实例名不符合格式要求。格式要求：字母开头，字母/数字结尾，中间支持字母、数字和中划线	请输入正确的实例名称
400	CCI.04.400214	The update action must be either upgrade or rollback	更新应用失败：请求的action不合法，支持：upgrade和rollback	请求的action只支持upgrade和rollback
400	CCI.04.400218	Invalid release version	请求失败：请求的version字段不合法	请输入正确的version字段
400	CCI.04.400302	Failed to Unmarshal	请求失败，请检查body格式是否正确	请提供正确的body格式
400	CCI.04.400304	The request body is too large	请求失败：模板包超过了2M的最大限制	请确保模板包小于2M
400	CCI.04.400306	Validate chart package failed	校验模板包格式时发生错误，请检查模板中yaml文件格式是否正确	请检查模板中yaml文件格式是否正确
404	CCI.04.404204	Release not found	请求失败：查询的应用不存在	请查询正确的应用

状态码	错误码	错误信息	描述	处理措施
409	CCI.04.409112	The chart is already existed in database	模板上传失败，模板名字已存在	请修改模板名字后重试
409	CCI.04.409123	The chart name is conflict with public charts	模板上传失败，模板名与官方模板名冲突	请修改模板名字后重试
409	CCI.04.409213	Release already exists in this cluster	创建实例失败，实例名称重复	请修改实例名称后重试
400	CCI.02.400101	ummarshal ERROR : BadNamespaceRequestBody	创建 namespace 失败：请求结构体错误	根据接口文档排查请求体错误
400	CCI.02.400102	get service account tenant name failed	资源租户获取租户名失败：资源租户不在白名单内	请获取存在白名单内的租户
400	CCI.02.400103	Unsupported Content Type	请求携带文本类型错误	请提供正确的文本类型
400	CCI.02.400104	ummarshal ERROR : BadQuotaRequestBody	创建配额失败：请求结构体错误	请提供正确的结构体

状态码	错误码	错误信息	描述	处理措施
400	CCI.02.400105	update quotas failed	配额更新失败	请联系技术支持
400	CCI.02.400106	used namespaces exceeds quota, could not create any more	创建 namespace 失败: namespace 配额不足	请联系技术支持
400	CCI.02.400107	delete namespace failed, namespace is empty	删除 namespace 失败: namespace 为空, 无法删除	请删除不为空的namespace
400	CCI.02.400108	get flavor info by name failed, flavor name is empty	通过name查询flavor信息失败: name 字段为空	请输入正确的name字段
400	CCI.02.400109	Create namespace failed: NamespaceNameInvalid	创建 namespace 失败: Name字段不合法	请输入正确的name字段
400	CCI.02.400110	Create namespace failed: NamespaceFlavorInvalid	创建 namespace 失败: Flavor字段不合法	请输入正确的Flavor字段

状态码	错误码	错误信息	描述	处理措施
400	CCI.02.400111	Create namespace failed: NamespaceFlavorMissed	创建 namespace 失败: Flavor字段为空	请输入正确的Flavor字段
400	CCI.02.400112	Create namespace failed: NamespaceDomainIDMissed	创建 namespace 失败: DomainID字段为空	请输入正确的DomainID字段
400	CCI.02.400113	Create namespace failed: NamespaceProjectIDMissed	创建 namespace 失败: ProjectID字段为空	请输入正确的ProjectID字段
400	CCI.02.400114	Get namespace failed: NamespaceProjectIDMissed	查询 namespace 失败: ProjectID字段为空	请输入正确的ProjectID字段
400	CCI.02.400116	Get available cluster info from resource manager failed: NoAllocatedCluster	创建 namespace 失败: 当前集群资源不足, 请稍后重试	请联系技术支持

状态码	错误码	错误信息	描述	处理措施
400	CCI.02.400117	Get namespace failed: PaginationParameterInvalid	查询 namespace 失败: 分页参数不合法	请输入正确的分页参数
400	CCI.02.400118	Create namespace failed: EnterpriseProjectIDEmpty	创建 namespace 失败: 企业项目ID为空	请输入正确的企业项目ID
400	CCI.02.400119	Create namespace failed: EnterpriseProjectNotSupported	创建 namespace 失败: 不支持设置企业项目	请联系技术支持
404	CCI.02.404101	flavor not found	查询flavor信息失败: 请求flavor不存在	请查询正确的flavor

400	CCI.03.400104	Request failed	请求失败： 无效的POC 套餐包	请购买有效套餐包

8.7 获取项目 ID

操作场景

在调用接口的时候，部分URL中需要填入项目ID，所以需要获取到项目ID。有如下两种获取方式：

- [调用API获取项目ID](#)
- [从控制台获取项目ID](#)

调用 API 获取项目 ID

项目ID可以通过调用[查询指定条件下的项目列表](#)API获取。

获取项目ID的接口为“GET https://{Endpoint}/v3/projects”，其中{Endpoint}为IAM的终端节点，可以从[地区和终端节点](#)获取。接口的认证鉴权请参见[认证鉴权](#)。

响应示例如下，其中projects下的“id”即为项目ID。

```
{
  "projects": [
    {
      "domain_id": "65ewtrgaggshhk1223245sghjlse684b",
      "is_domain": false,
      "parent_id": "65ewtrgaggshhk1223245sghjlse684b",
      "name": "project_name",
      "description": "",
      "links": {
        "next": null,
        "previous": null,
        "self": "https://www.example.com/v3/projects/a4adasfjljaaakla12334jklga9sasfg"
      },
      "id": "a4adasfjljaaakla12334jklga9sasfg",
      "enabled": true
    }
  ],
  "links": {
```

```
"next": null,  
"previous": null,  
"self": "https://www.example.com/v3/projects"  
}  
}
```

从控制台获取项目 ID

从控制台获取项目ID的步骤如下：

1. 登录管理控制台。
2. 鼠标悬停在右上角的用户名，选择下拉列表中的“我的凭证”。
在“API凭证”页面的项目列表中查看项目ID。

图 8-8 查看项目 ID

8.8 获取账号 ID

在调用接口的时候，部分URL中需要填入账号ID（domain-id），所以需要先在管理控制台上获取到账号ID。账号ID获取步骤如下：

1. 登录管理控制台。
2. 单击用户名，在下拉列表中单击“我的凭证”。
在“我的凭证”页面查看账号ID。

图 8-9 获取账号 ID

8.9 获取容器镜像地址

云容器实例支持使用镜像中心和上传到容器镜像服务的镜像。其中

- **容器镜像服务**从镜像中心同步了部分常用镜像，使得您可以在内部网络中直接使用“镜像名称:版本号”，如nginx:alpine，您可以在容器镜像服务控制台中查询同步了哪些镜像。
- 容器镜像服务中的镜像请使用镜像的“下载指令”，上传镜像后，您可以在容器镜像服务的镜像中获取，如下图所示。

图 8-10 镜像地址

9 历史 API

9.1 Kubernetes API（废弃）

📖 说明

当前页面API已经废弃，请使用[Kubernetes API](#)。

9.1.1 Extended PersistentVolumeClaim

9.1.1.1 导入存储

功能介绍

导入已有存储到指定的命名空间。

当前支持导入EVS（云硬盘卷，块存储）、SFS（文件存储卷）、SFS Turbo（极速文件存储卷）、OBS（对象存储卷），使用时 `spec.storageClassName` 参数的取值如下：

- sata：普通I/O云硬盘卷
- sas：高I/O云硬盘卷
- ssd：超高I/O云硬盘卷
- nfs-rw：标准文件协议类型文件存储卷
- efs-performance：性能型极速文件存储卷
- efs-standard：标准型极速文件存储卷
- obs：对象存储卷

📖 说明

- 回收策略采用 **DELETE**，即PVC被删除后，立即删除存储。如果需要保留存储，可使用[解绑存储](#)接口。
- OBS对象存储包含“对象桶”和“并行文件系统”两种类型。并行文件系统是OBS提供了一种经过优化的高性能文件系统，提供毫秒级别访问时延，以及TB/s级别带宽和百万级别的IOPS，相较于OBS对象存储在稳定性、性能上更具优势。因此如需通过挂载方式，**生产环境中推荐您使用OBS并行文件系统**，而不推荐OBS对象存储。

URI

POST /api/v1/namespaces/{namespace}/extended-persistentvolumeclaims

表 9-1 Path 参数

参数	参数类型	描述
namespace	String	命名空间。

请求消息

请求参数

表 9-2 PersistentVolumeClaim v1 数据结构说明

参数	是否必选	参数类型	描述
apiVersion	Yes	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values.
kind	Yes	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated.
metadata	Yes	Object	Standard object's metadata. 详情请参见表6-131。 其中annotations字段请参见表9-3。
spec	Yes	Object	Spec defines the desired characteristics of a volume requested by a pod author. 详情请参见表6-298。
status	No	Object	Status represents the current information/status of a persistent volume claim. Read-only. 详情请参见表6-299。

表 9-3 metadata.annotations 字段说明

参数	是否必选	参数类型	描述
fsType	Yes	String	文件系统名称。可设置为： <ul style="list-style-type: none">• 块存储：ext4• 对象存储：obs• 文件存储、极速文件存储：nfs
volumeID	Yes	String	卷id。
deviceMountPath	No	String	共享路径。 说明 只有文件存储卷和极速文件存储卷需要设置该值。

请求示例

```
{
  "apiVersion": "v1",
  "kind": "PersistentVolumeClaim",
  "metadata": {
    "annotations": {
      "fsType": "nfs",
      "volumeID": "378dfa73-3ae4-4179-81c0-67699976b505",
      "deviceMountPath": "sfs-nas01.cn-north-4b.myhuaweicloud.com/share-84b38e4d"
    },
    "name": "cci-sfs-jxre8q80-ylpd",
    "namespace": "test-namespace"
  },
  "spec": {
    "resources": {
      "requests": {
        "storage": "10Gi"
      }
    },
    "storageClassName": "nfs-rw"
  }
}
```

响应消息

响应参数

表 9-4 响应参数

参数	类型	描述
PersistentVolumeClaim	Object	详情请参见 表6-296 。

响应示例

```
{
  "metadata": {
```

```
{
  "name": "pvc-import-efs",
  "namespace": "test-namespace",
  "selfLink": "/api/v1/namespaces/test-namespace/persistentvolumeclaims/pvc-import-efs",
  "uid": "17646a17-a471-11e9-be8a-b44326d0c915",
  "resourceVersion": "65016560",
  "creationTimestamp": "2019-07-12T06:48:44Z",
  "annotations": {
    "kubernetes.io/volumeld": "378dfa73-3ae4-4179-81c0-67699976b505"
  }
},
"spec": {
  "accessModes": [
    "ReadWriteMany"
  ],
  "resources": {
    "requests": {
      "storage": "10"
    }
  },
  "storageClassName": "sata"
},
"status": {
  "phase": "Pending"
}
}
```

状态码

表 9-5 状态码

状态码	描述
200	Export volume success.

更多状态码请参见[状态码](#)。

9.1.1.2 查询导入的 PVC

功能介绍

查询指定命名空间下的PVC。

URI

GET /api/v1/namespaces/{namespace}/extended-persistentvolumeclaims

表 9-6 Path 参数

参数	是否必选	参数类型	描述
namespace	Yes	String	命名空间。

表 9-7 Query 参数

参数	是否必选	参数类型	描述
storageType	No	String	Type of storage, 目前支持: <ul style="list-style-type: none">• bs: 云硬盘存储• nfs: 文件存储• efs: 极速文件存储 如果本参数未指定, 将默认返回当前命名空间下bs(云硬盘存储)类型的PVC信息。

请求消息

N/A

响应消息

响应参数

表 9-8 响应参数

参数	参数类型	描述
PersistentVolumeClaim	Object	详情请参见 表6-296 。
PersistentVolume	Object	详情请参见 表6-305 。
StorageInfo	Object	详情请参见 表6-320 。

响应示例

```

9.1.2 TFJob

9.1.2.1 创建 TFJob

功能介绍

创建TFJob。

TFJob即Tensorflow任务，是基于Tensorflow开源框架的kubernetes自定义资源类型，有多种角色可以配置，能够帮助我们更简单地实现Tensorflow的单机或分布式训练。Tensorflow开源框架的信息详见：<https://www.tensorflow.org>。

URI

POST /apis/kubeflow.org/v1/namespaces/{namespace}/tfjobs

表 9-13 Path 参数

参数	是否必选	描述
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-14 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

请求参数：

请求参数的详细描述请参见[表6-275](#)。

请求示例：

```
{
  "apiVersion": "kubeflow.org/v1",

9.1.2.2 查询 TFJob

功能介绍

查询TFJob的详细信息。

URI

GET /apis/kubeflow.org/v1/namespaces/{namespace}/tfjobs/{name}

表 9-16 Path 参数

参数	是否必选	描述
name	Yes	name of the TFJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-17 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

N/A

9.1.2.3 查询指定 namespace 下的所有 TFJob

功能介绍

查询Namespace下所有TFJob的详细信息。

URI

GET /apis/kubeflow.org/v1/namespaces/{namespace}/tfjobs

表 9-19 Path 参数

参数	是否必选	描述
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-20 Query 参数

参数	是否必选	描述
fieldSelector	No	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	No	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the continue field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	No	When specified with a watch call, shows changes that occur after that particular version of a resource. Defaults to changes from the beginning of history. When specified for list: - if unset, then the result is returned from remote storage based on quorum-read flag; - if it's 0, then we simply return what we currently have in cache, no guarantee; - if set to non zero, then the result is at least as fresh as given rv.
timeoutSeconds	No	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

参数	是否必选	描述
watch	No	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

9.1.2.5 删除 TFJob

功能介绍

删除TFJob。

URI

DELETE /apis/kubeflow.org/v1/namespaces/{namespace}/tfjobs/{name}

表 9-25 Path 参数

参数	是否必选	描述
name	Yes	name of the TFJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-26 Query 参数

参数	是否必选	描述
dryRun	No	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	No	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

参数	是否必选	描述
propagationPolicy	No	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	If 'true' , then the output is pretty printed.

请求消息

N/A

响应消息

响应参数:

响应参数的详细描述请参见[表6-193](#)。

响应示例:

```
{
  "kind": "Status",
  "apiVersion": "v1",
  "metadata": {},
  "status": "Success",
  "details": {
    "name": "tfjob-test",
    "group": "kubeflow.org",
    "kind": "tfjobs",
    "uid": "f461f966-ad46-11e9-aaa4-340a9837e413"
  }
}
```

403	Forbidden

9.1.2.6 更新 TFJob

功能介绍

更新TFJob。如下字段可被更新：

- metadata.labels
- metadata.annotations
- spec.activeDeadlineSeconds
- spec.ttlSecondsAfterFinished
- spec.cleanPodPolicy

URI

PATCH /apis/kubeflow.org/v1/namespaces/{namespace}/tfjobs/{name}

表 9-28 Path 参数

参数	是否必选	描述
name	Yes	name of the TFJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-29 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

请求参数：

“Content-Type” 消息头说明请参见[PATCH请求方法操作说明](#)。

📖 说明

目前只支持“Merge Patch”。

请求示例：

```
Content-Type: application/merge-patch+json
{
  "metadata": {
    "labels": {
      "app": "test"
    }
  }
}
```

```
}  
}
```

响应消息

响应参数:

响应参数的详细描述请参见[表6-275](#)。

响应示例:

```

9.1.2.7 替换 TFJob

功能介绍

替换TFJob。如下字段可被替换：

- metadata.labels
- metadata.annotations
- spec.activeDeadlineSeconds
- spec.ttlSecondsAfterFinished
- spec.cleanPodPolicy

URI

PUT /apis/kubeflow.org/v1/namespaces/{namespace}/tfjobs/{name}

表 9-31 Path 参数

参数	是否必选	描述
name	Yes	name of the TFJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-32 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

请求参数的详细描述请参见[表6-275](#)。

请求示例：

更改TFJob的结束存活时间ttlSecondsAfterFinished：

```
{
  "apiVersion": "kubeflow.org/v1",
  "kind": "TFJob",
  "metadata": {
    "creationTimestamp": "2019-07-24T07:17:01Z",
    "generation": 2,
    "labels": {
      "app": "test"
    },
    "name": "tfjob-test",
    "namespace": "kube-test",
    "resourceVersion": "72447176",
    "selfLink": "/apis/kubeflow.org/v1/namespaces/kube-test/tfjobs/tfjob-test",
    "uid": "083cc6df-ade3-11e9-aaa4-340a9837e413"
  },
  "spec": {
    "backoffLimit": 6,
    "tfReplicaSpecs": {
      "Ps": {
        "replicas": 1,
        "template": {
          "spec": {
            "containers": [
              {
                "args": [
                  "python",
                  "/opt/tf-benchmarks/scripts/tf_cnn_benchmarks/tf_cnn_benchmarks.py",
                  "--batch_size=1",
                  "--model=resnet50",

9.1.3 MXJob

9.1.3.1 创建 MXJob

功能介绍

创建MXJob。

MXJob即MXNet任务，是基于MXNet开源框架的kubernetes自定义资源类型，有多种角色可以配置，能够帮助我们更简单地实现MXNet的训练。MXNet开源框架的信息详见：<https://mxnet.incubator.apache.org/>。

URI

POST /apis/kubeflow.org/v1/namespaces/{namespace}/mxjobs

表 9-34 Path 参数

参数	是否必选	描述
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-35 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

请求参数：

请求参数的详细描述请参考[表6-283](#)。

请求示例：

```
{
  "apiVersion": "kubeflow.org/v1",
  "kind": "MXJob",
  "metadata": {
    "name": "mxnet-job"
  },
}
```

```
"spec": {
  "cleanPodPolicy": "Running",
  "jobMode": "MXTrain",
  "mxReplicaSpecs": {
    "Scheduler": {
      "replicas": 1,
      "restartPolicy": "Never",
      "template": {
        "spec": {
          "imagePullSecrets": [
            {
              "name": "imagepull-secret"
            }
          ],
          "containers": [
            {
              "name": "mxnet",
              "image": "**:*:215:20202/cci/mxnet:xsw-dis",
              "command": [
                "/bin/bash"
              ],
              "args": [
                "-c",
                "python train_imagenet.py"
              ],
              "resources": {

9.1.3.3 查询指定 namespace 下的所有 MXJob

功能介绍

查询Namespace下所有MXJob的详细信息。

URI

GET /apis/kubeflow.org/v1/namespaces/{namespace}/mxjobs

表 9-40 Path 参数

参数	是否必选	描述
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-41 Query 参数

参数	是否必选	描述
fieldSelector	No	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	A selector to restrict the list of returned objects by their labels. Defaults to everything.
limit	No	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the continue field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	No	When specified with a watch call, shows changes that occur after that particular version of a resource. Defaults to changes from the beginning of history. When specified for list: - if unset, then the result is returned from remote storage based on quorum-read flag; - if it's 0, then we simply return what we currently have in cache, no guarantee; - if set to non zero, then the result is at least as fresh as given rv.
timeoutSeconds	No	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.

参数	是否必选	描述
watch	No	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

表 3 状态码描述API的状态码。

表 9-45 状态码

状态码	描述
200	OK
401	Unauthorized
500	Internal error

9.1.3.5 删除 MXJob

功能介绍

删除MXJob。

URI

DELETE /apis/kubeflow.org/v1/namespaces/{namespace}/mxjobs/{name}

表 9-46 Path 参数

参数	是否必选	描述
name	Yes	name of the MXJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-47 Query 参数

参数	是否必选	描述
dryRun	No	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	No	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the “orphan” finalizer will be added to/removed from the object’s finalizers list. Either this field or PropagationPolicy may be set, but not both.

参数	是否必选	描述
propagationPolicy	No	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	If 'true' , then the output is pretty printed.

9.1.3.6 更新 MXJob

功能介绍

更新MXJob。如下字段可被更新：

- metadata.labels
- metadata.annotations
- spec.activeDeadlineSeconds
- spec.ttlSecondsAfterFinished
- spec.cleanPodPolicy

URI

PATCH /apis/kubeflow.org/v1/namespaces/{namespace}/mxjobs/{name}

表 9-49 Path 参数

参数	是否必选	描述
name	Yes	name of the MXJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-50 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

请求参数：

“Content-Type” 消息头说明请参见[PATCH请求方法操作说明](#)。

📖 说明

目前只支持“Merge Patch”。

请求示例：

```
Content-Type: application/merge-patch+json
{
  "metadata": {
    "labels": {
      "app": "test"
    }
  }
}
```

```
}  
}
```

响应消息

响应参数:

响应参数的详细描述请参见[表6-283](#)。

响应示例:

```
{  
  "apiVersion": "kubeflow.org/v1",

状态码

表 9-51 状态码

状态码	描述
200	OK
401	Unauthorized
500	Internal Error
403	Forbidden
409	Conflict
400	BadRequest

9.1.3.7 替换 MXJob

功能介绍

替换MXJob。如下字段可被替换：

- metadata.labels
- metadata.annotations
- spec.activeDeadlineSeconds
- spec.ttlSecondsAfterFinished
- spec.cleanPodPolicy

URI

PUT /apis/kubeflow.org/v1/namespaces/{namespace}/mxjobs/{name}

表 9-52 Path 参数

参数	是否必选	描述
name	Yes	name of the MXJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-53 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

请求参数:

请求参数的详细描述请参见[表6-283](#)。

请求示例:

更改MXJob的结束存活时间ttlSecondsAfterFinished:

```
{
  "apiVersion": "kubeflow.org/v1",
  "kind": "MXJob",
  "metadata": {
    "creationTimestamp": "2019-07-29T03:34:33Z",
    "generation": 2,
    "name": "mxnet-job",
    "namespace": "kube-test",
    "resourceVersion": "75615427",
    "selfLink": "/apis/kubeflow.org/v1/namespaces/kube-test/mxjobs/mxnet-job",

9.1.4 PyTorchJob

9.1.4.1 创建 PyTorchJob

功能介绍

创建PyTorchJob。

PyTorchJob即PyTorch任务，是基于PyTorch开源框架的kubernetes自定义资源类型，有多种角色可以配置，能够帮助我们更简单地实现PyTorch的训练。

URI

POST /apis/kubeflow.org/v1/namespaces/{namespace}/pytorchjobs

表 9-55 Path 参数

参数	是否必选	描述
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-56 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

请求参数：

请求参数的详细描述请参见[表6-286](#)。

请求示例：

```
{
  "apiVersion": "kubeflow.org/v1",
  "kind": "PyTorchJob",
  "metadata": {
    "name": "pytorch-test"
  },
  "spec": {
    "pytorchReplicaSpecs": {

9.1.4.2 查询 PyTorchJob

功能介绍

查询PyTorchJob的详细信息。

URI

GET /apis/kubeflow.org/v1/namespaces/{namespace}/pytorchjobs/{name}

表 9-58 Path 参数

参数	是否必选	描述
name	Yes	name of the PyTorchJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-59 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

9.1.4.3 查询指定 namespace 下的所有 PyTorchJob

功能介绍

查询Namespace下所有PyTorchJob的详细信息。

URI

GET /apis/kubeflow.org/v1/namespaces/{namespace}/pytorchjobs

表 9-61 Path 参数

参数	是否必选	描述
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-62 Query 参数

参数	是否必选	描述
fieldSelector	No	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	描述
limit	No	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the continue field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
resourceVersion	No	<p>When specified with a watch call, shows changes that occur after that particular version of a resource. Defaults to changes from the beginning of history. When specified for list: - if unset, then the result is returned from remote storage based on quorum-read flag; - if it's 0, then we simply return what we currently have in cache, no guarantee; - if set to non zero, then the result is at least as fresh as given rv.</p>
timeoutSeconds	No	<p>Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.</p>
watch	No	<p>Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.</p>

状态码	描述
200	OK
401	Unauthorized
500	Internal error

9.1.4.5 删除 PyTorchJob

功能介绍

删除PyTorchJob。

URI

DELETE /apis/kubeflow.org/v1/namespaces/{namespace}/pytorchjobs/{name}

表 9-67 Path 参数

参数	是否必选	描述
name	Yes	name of the PyTorchJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-68 Query 参数

参数	是否必选	描述
dryRun	No	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

参数	是否必选	描述
orphanDependents	No	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	If 'true', then the output is pretty printed.

请求消息

N/A

响应消息

响应参数:

响应参数的详细描述请参见[表6-193](#)。

响应示例:

```
{
  "kind": "Status",
  "apiVersion": "v1",
  "metadata": {},
  "status": "Success",
  "details": {
    "name": "pytorch-test",
    "group": "kubeflow.org",
    "kind": "pytorchjobs",
    "uid": "be7696f9-adfe-11e9-aaa4-340a9837e413"
  }
}
```

401	Unauthorized
500	Internal Error
403	Forbidden

9.1.4.6 更新 PyTorchJob

功能介绍

更新PyTorchJob。如下字段可被更新：

- metadata.labels
- metadata.annotations
- spec.activeDeadlineSeconds
- spec.ttlSecondsAfterFinished
- spec.cleanPodPolicy

URI

PATCH /apis/kubeflow.org/v1/namespaces/{namespace}/pytorchjobs/{name}

表 9-70 Path 参数

参数	是否必选	描述
name	Yes	name of the PyTorchJob
namespace	Yes	object name and auth scope, such as for teams and projects

表 9-71 Query 参数

参数	是否必选	描述
pretty	No	If 'true' , then the output is pretty printed.

请求消息

请求参数：

“Content-Type” 消息头说明请参见[PATCH请求方法操作说明](#)。

📖 说明

目前只支持“Merge Patch”。

请求示例:

```
Content-Type: application/merge-patch+json
{
  "metadata": {
    "labels": {
      "app": "test"
    }
  }
}
```

响应消息

响应参数:

响应参数的详细描述请参见[表6-286](#)。

响应示例:

```
{
  "apiVersion": "kubeflow.org/v1",
  "kind": "PyTorchJob",
  "metadata": {
    "creationTimestamp": "2019-07-24T10:35:38Z",
