items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-3055 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-3056 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-3057 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-3058 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-3059 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-3060 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-3061 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-3062 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-3063 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-3064 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-3065 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-3066 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-3067 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-3068 io.k8s.api.apps.v1.DeploymentStatus

参数	参数类型	描述
availableReplicas	Integer	Total number of available pods (ready for at least minReadySeconds) targeted by this deployment.
collisionCount	Integer	Count of hash collisions for the Deployment. The Deployment controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ReplicaSet.
conditions	Array of io.k8s.api.apps.v1.DeploymentCondition objects	Represents the latest available observations of a deployment's current state.
observedGeneration	Long	The generation observed by the deployment controller.
readyReplicas	Integer	Total number of ready pods targeted by this deployment.
replicas	Integer	Total number of non-terminated pods targeted by this deployment (their labels match the selector).
unavailableReplicas	Integer	Total number of unavailable pods targeted by this deployment. This is the total number of pods that are still required for the deployment to have 100% available capacity. They may either be pods that are running but not yet available or pods that still have not been created.

参数	参数类型	描述
updatedReplicas	Integer	Total number of non-terminated pods targeted by this deployment that have the desired template spec.

表 5-3069 io.k8s.api.apps.v1.DeploymentCondition

参数	参数类型	描述
lastTransitionTime	String	Last time the condition transitioned from one status to another.
lastUpdateTime	String	The last time this condition was updated.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of deployment condition.

5.6 Ingress

5.6.1 删除指定 namespace 下的 ingresses

功能介绍

删除Namespace下所有Ingress。

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/extensions/v1beta1/namespaces/{namespace}/ingresses

表 5-3070 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3071 Query 参数

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

参数	是否必选	参数类型	描述
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3072 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3073 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-3074 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-3075 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3076 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3077 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3078 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.6.2 查询指定 namespace 下的 Ingresses

功能介绍

查询Namespace下所有Ingress的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/extensions/v1beta1/namespaces/{namespace}/ingresses

表 5-3079 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3080 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3081 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3082 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.extensions.v1beta1.Ingress objects	Items is the list of Ingress.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-3083 io.k8s.api.extensions.v1beta1.Ingress

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3084 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3085 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3086 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3087 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3088 io.k8s.api.extensions.v1beta1.IngressRule

参数	参数类型	描述
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

表 5-3089 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	参数类型	描述
paths	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	<p>A collection of paths that map requests to backends.</p>

表 5-3090 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	Map<String,String>	Extension property on the path.

表 5-3091 io.k8s.api.extensions.v1beta1.IngressBackend

参数	参数类型	描述
resource	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

参数	参数类型	描述
servicePort	String	Specifies the port of the referenced service.

表 5-3092 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3093 io.k8s.api.extensions.v1beta1.IngressTLS

参数	参数类型	描述
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3094 io.k8s.api.extensions.v1beta1.IngressStatus

参数	参数类型	描述
loadBalancer	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3095 io.k8s.api.core.v1.LoadBalancerStatus

参数	参数类型	描述
ingress	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3096 io.k8s.api.core.v1.LoadBalancerIngress

参数	参数类型	描述
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

表 5-3097 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.6.3 创建 Ingress

功能介绍

创建Ingress，使用http协议，关联的后端Service为“redis:8080”，使用ELB作为Ingress控制器，ELB的ip为192.168.137.182，端口号为6071。

说明：

若需要在CCI工作负载详情页面的“访问方式”页签中显示对应的Ingress资源，则需要给创建的Ingress资源对象添加labels标签。添加的标签需满足如下要求：

- service的labels中设置的标签必须和负载的selector中matchLabels设置的label一致。

例如，负载中matchLabels标签设置如下：

```
"spec": {
  "replicas": 1,
  "selector": {
    "matchLabels": {
      "app": "redis"
    }
  }
}
```

service中的labels也必须设置为**"app": "redis"**：

```
"metadata": {
  "name": "redis",
  "labels": {
    "app": "redis"
  }
}
```

- ingress中定义的serviceName必须和service中定义的名称一致。

调用方法

请参见[如何调用API](#)。

URI

POST /apis/extensions/v1beta1/namespaces/{namespace}/ingresses

表 5-3098 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3099 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3100 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3101 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	否	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3102 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3103 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3104 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3105 io.k8s.api.extensions.v1beta1.IngressSpec

参数	是否必选	参数类型	描述
backend	否	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.

参数	是否必选	参数类型	描述
ingressClassName	否	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	否	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	否	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3106 io.k8s.api.extensions.v1beta1.IngressRule

参数	是否必选	参数类型	描述
host	否	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The <code>:</code> delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly <code>:80</code> for http and <code>:443</code> for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). The wildcard character <code>*</code> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>

参数	是否必选	参数类型	描述
http	否	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.

表 5-3107 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	是否必选	参数类型	描述
paths	是	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	A collection of paths that map requests to backends.

表 5-3108 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	是否必选	参数类型	描述
backend	是	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	否	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.

参数	是否必选	参数类型	描述
pathType	否	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: *</p> <ul style="list-style-type: none">Exact: Matches the URL path exactly.Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers to the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	否	Map<String,String>	Extension property on the path.

表 5-3109 io.k8s.api.extensions.v1beta1.IngressBackend

参数	是否必选	参数类型	描述
resource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.

参数	是否必选	参数类型	描述
serviceName	否	String	Specifies the name of the referenced service.
servicePort	否	String	Specifies the port of the referenced service.

表 5-3110 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-3111 io.k8s.api.extensions.v1beta1.IngressTLS

参数	是否必选	参数类型	描述
hosts	否	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.

参数	是否必选	参数类型	描述
secretName	否	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3112 io.k8s.api.extensions.v1beta1.IngressStatus

参数	是否必选	参数类型	描述
loadBalancer	否	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3113 io.k8s.api.core.v1.LoadBalancerStatus

参数	是否必选	参数类型	描述
ingress	否	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3114 io.k8s.api.core.v1.LoadBalancerIngress

参数	是否必选	参数类型	描述
hostname	否	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	否	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

响应参数

状态码： 200

表 5-3115 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3116 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. 参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3117 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3118 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3119 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3120 io.k8s.api.extensions.v1beta1.IngressRule

参数	参数类型	描述
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

表 5-3121 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	参数类型	描述
paths	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	<p>A collection of paths that map requests to backends.</p>

表 5-3122 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	Map<String,String>	Extension property on the path.

表 5-3123 io.k8s.api.extensions.v1beta1.IngressBackend

参数	参数类型	描述
resource	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

参数	参数类型	描述
servicePort	String	Specifies the port of the referenced service.

表 5-3124 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3125 io.k8s.api.extensions.v1beta1.IngressTLS

参数	参数类型	描述
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3126 io.k8s.api.extensions.v1beta1.IngressStatus

参数	参数类型	描述
loadBalancer	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3127 io.k8s.api.core.v1.LoadBalancerStatus

参数	参数类型	描述
ingress	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3128 io.k8s.api.core.v1.LoadBalancerIngress

参数	参数类型	描述
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

状态码: 201

表 5-3129 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
spec	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3130 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3131 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3132 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3133 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3145 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3146 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3147 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3148 io.k8s.api.extensions.v1beta1.IngressRule

参数	参数类型	描述
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

表 5-3149 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	参数类型	描述
paths	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	<p>A collection of paths that map requests to backends.</p>

表 5-3150 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	Map<String,String>	Extension property on the path.

表 5-3151 io.k8s.api.extensions.v1beta1.IngressBackend

参数	参数类型	描述
resource	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

参数	参数类型	描述
servicePort	String	Specifies the port of the referenced service.

表 5-3152 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3153 io.k8s.api.extensions.v1beta1.IngressTLS

参数	参数类型	描述
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3154 io.k8s.api.extensions.v1beta1.IngressStatus

参数	参数类型	描述
loadBalancer	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3155 io.k8s.api.core.v1.LoadBalancerStatus

参数	参数类型	描述
ingress	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3156 io.k8s.api.core.v1.LoadBalancerIngress

参数	参数类型	描述
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

5.6.4 删除 Ingress

功能介绍

删除Ingress。

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}

表 5-3157 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Ingress
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3158 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

参数	是否必选	参数类型	描述
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3159 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3160 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

参数	是否必选	参数类型	描述
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.

参数	是否必选	参数类型	描述
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-3161 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-3162 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.

参数	参数类型	描述
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3163 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.

参数	参数类型	描述
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3164 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3165 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

状态码： 202

reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3169 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.6.5 查询 Ingress

功能介绍

查询Ingress的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}

表 5-3170 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Ingress
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3171 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3172 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3173 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3174 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3175 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3176 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3177 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3178 io.k8s.api.extensions.v1beta1.IngressRule

参数	参数类型	描述
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

表 5-3179 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	参数类型	描述
paths	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	<p>A collection of paths that map requests to backends.</p>

表 5-3180 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values:</p> <ul style="list-style-type: none">* Exact: Matches the URL path exactly.* Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	Map<String,String>	Extension property on the path.

表 5-3181 io.k8s.api.extensions.v1beta1.IngressBackend

参数	参数类型	描述
resource	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

参数	参数类型	描述
servicePort	String	Specifies the port of the referenced service.

表 5-3182 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3183 io.k8s.api.extensions.v1beta1.IngressTLS

参数	参数类型	描述
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3184 io.k8s.api.extensions.v1beta1.IngressStatus

参数	参数类型	描述
loadBalancer	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3185 io.k8s.api.core.v1.LoadBalancerStatus

参数	参数类型	描述
ingress	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3186 io.k8s.api.core.v1.LoadBalancerIngress

参数	参数类型	描述
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

5.6.6 更新 Ingress

功能介绍

更新Ingress。

其中以下字段支持更新：

- metadata.labels
- metadata.generateName
- metadata.annotations
- spec.rules

调用方法

请参见[如何调用API](#)。

URI

PATCH /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}

表 5-3187 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Ingress
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3188 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).

参数	是否必选	参数类型	描述
force	否	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3189 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	是否必选	参数类型	描述
Content-Type	是	String	<p>目前支持三种类型的PATCH请求方法的操作，参考《使用JSON合并patch更新Deployment》。</p> <ol style="list-style-type: none">1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

表 5-3190 请求 Body 参数

参数	是否必选	参数类型	描述
-	是	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

响应参数

状态码： 200

表 5-3191 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3192 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3193 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3194 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3195 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3196 io.k8s.api.extensions.v1beta1.IngressRule

参数	参数类型	描述
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

表 5-3197 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	参数类型	描述
paths	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	<p>A collection of paths that map requests to backends.</p>

表 5-3198 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	Map<String,String>	Extension property on the path.

表 5-3199 io.k8s.api.extensions.v1beta1.IngressBackend

参数	参数类型	描述
resource	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

参数	参数类型	描述
servicePort	String	Specifies the port of the referenced service.

表 5-3200 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3201 io.k8s.api.extensions.v1beta1.IngressTLS

参数	参数类型	描述
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3202 io.k8s.api.extensions.v1beta1.IngressStatus

参数	参数类型	描述
loadBalancer	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3203 io.k8s.api.core.v1.LoadBalancerStatus

参数	参数类型	描述
ingress	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3204 io.k8s.api.core.v1.LoadBalancerIngress

参数	参数类型	描述
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

请求示例

更新Ingress的servicePort值为"8082"。

```
{
  "spec": {
    "rules": [ {
      "http": {
        "paths": [ {
          "backend": {
            "serviceName": "redis",
            "servicePort": 8082
          },
          "path": "/"
        } ]
      }
    } ]
  }
}
```

响应示例

5.6.7 替换 Ingress

功能介绍

替换Ingress。

其中以下字段支持更新：

- metadata.labels
- metadata.generateName
- metadata.annotations
- spec.rules

调用方法

请参见[如何调用API](#)。

URI

PUT /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}

表 5-3205 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Ingress
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3206 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

参数	是否必选	参数类型	描述
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3207 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3208 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	是否必选	参数类型	描述
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	否	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3209 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	是否必选	参数类型	描述
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3210 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3211 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3212 io.k8s.api.extensions.v1beta1.IngressSpec

参数	是否必选	参数类型	描述
backend	否	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.

参数	是否必选	参数类型	描述
ingressClassName	否	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	否	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	否	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3213 io.k8s.api.extensions.v1beta1.IngressRule

参数	是否必选	参数类型	描述
host	否	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The <code>:</code> delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly <code>:80</code> for http and <code>:443</code> for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). The wildcard character <code>*</code> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>

参数	是否必选	参数类型	描述
http	否	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.

表 5-3214 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	是否必选	参数类型	描述
paths	是	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	A collection of paths that map requests to backends.

表 5-3215 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	是否必选	参数类型	描述
backend	是	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	否	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.

参数	是否必选	参数类型	描述
pathType	否	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: *</p> <ul style="list-style-type: none">Exact: Matches the URL path exactly.Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	否	Map<String,String>	Extension property on the path.

表 5-3216 io.k8s.api.extensions.v1beta1.IngressBackend

参数	是否必选	参数类型	描述
resource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.

参数	是否必选	参数类型	描述
serviceName	否	String	Specifies the name of the referenced service.
servicePort	否	String	Specifies the port of the referenced service.

表 5-3217 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-3218 io.k8s.api.extensions.v1beta1.IngressTLS

参数	是否必选	参数类型	描述
hosts	否	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.

参数	是否必选	参数类型	描述
secretName	否	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3219 io.k8s.api.extensions.v1beta1.IngressStatus

参数	是否必选	参数类型	描述
loadBalancer	否	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3220 io.k8s.api.core.v1.LoadBalancerStatus

参数	是否必选	参数类型	描述
ingress	否	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3221 io.k8s.api.core.v1.LoadBalancerIngress

参数	是否必选	参数类型	描述
hostname	否	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	否	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

响应参数

状态码： 200

表 5-3222 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3223 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3224 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3225 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3226 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3227 io.k8s.api.extensions.v1beta1.IngressRule

参数	参数类型	描述
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

表 5-3228 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	参数类型	描述
paths	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	A collection of paths that map requests to backends.

表 5-3229 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	Map<String,String>	Extension property on the path.

表 5-3230 io.k8s.api.extensions.v1beta1.IngressBackend

参数	参数类型	描述
resource	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

参数	参数类型	描述
servicePort	String	Specifies the port of the referenced service.

表 5-3231 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3232 io.k8s.api.extensions.v1beta1.IngressTLS

参数	参数类型	描述
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3233 io.k8s.api.extensions.v1beta1.IngressStatus

参数	参数类型	描述
loadBalancer	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3234 io.k8s.api.core.v1.LoadBalancerStatus

参数	参数类型	描述
ingress	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3235 io.k8s.api.core.v1.LoadBalancerIngress

参数	参数类型	描述
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

状态码: 201

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3238 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3239 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3240 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3241 io.k8s.api.extensions.v1beta1.IngressRule

参数	参数类型	描述
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

表 5-3242 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	参数类型	描述
paths	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	<p>A collection of paths that map requests to backends.</p>

表 5-3243 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	Map<String,String>	Extension property on the path.

表 5-3244 io.k8s.api.extensions.v1beta1.IngressBackend

参数	参数类型	描述
resource	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

参数	参数类型	描述
servicePort	String	Specifies the port of the referenced service.

表 5-3245 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3246 io.k8s.api.extensions.v1beta1.IngressTLS

参数	参数类型	描述
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3247 io.k8s.api.extensions.v1beta1.IngressStatus

参数	参数类型	描述
loadBalancer	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3248 io.k8s.api.core.v1.LoadBalancerStatus

参数	参数类型	描述
ingress	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3249 io.k8s.api.core.v1.LoadBalancerIngress

参数	参数类型	描述
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

请求示例

将Ingress的servicePort由"8080"替换为"8081"。

```
{
  "apiVersion": "extensions/v1beta1",
  "kind": "Ingress",

5.6.8 查询 Ingress 状态

功能介绍

查询Ingress状态。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}/status

表 5-3250 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Ingress
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3251 Query 参数

参数	是否必选	参数类型	描述
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3252 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3253 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.extensions.v1beta1.IngressSpec object	Spec is the desired state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.extensions.v1beta1.IngressStatus object	Status is the current state of the Ingress. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3254 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3255 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3256 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3257 io.k8s.api.extensions.v1beta1.IngressSpec

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of io.k8s.api.extensions.v1beta1.IngressRule objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of io.k8s.api.extensions.v1beta1.IngressTLS objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

表 5-3258 io.k8s.api.extensions.v1beta1.IngressRule

参数	参数类型	描述
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

表 5-3259 io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

参数	参数类型	描述
paths	Array of io.k8s.api.extensions.v1beta1.HTTPIngressPath objects	<p>A collection of paths that map requests to backends.</p>

表 5-3260 io.k8s.api.extensions.v1beta1.HTTPIngressPath

参数	参数类型	描述
backend	io.k8s.api.extensions.v1beta1.IngressBackend object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values:</p> <ul style="list-style-type: none">* Exact: Matches the URL path exactly.* Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz). <ul style="list-style-type: none">ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.
property	Map<String,String>	Extension property on the path.

表 5-3261 io.k8s.api.extensions.v1beta1.IngressBackend

参数	参数类型	描述
resource	io.k8s.api.core.v1.TypedLocalObjectReference object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

参数	参数类型	描述
servicePort	String	Specifies the port of the referenced service.

表 5-3262 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3263 io.k8s.api.extensions.v1beta1.IngressTLS

参数	参数类型	描述
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

表 5-3264 io.k8s.api.extensions.v1beta1.IngressStatus

参数	参数类型	描述
loadBalancer	io.k8s.api.core.v1.LoadBalancerStatus object	LoadBalancer contains the current status of the load-balancer.

表 5-3265 io.k8s.api.core.v1.LoadBalancerStatus

参数	参数类型	描述
ingress	Array of io.k8s.api.core.v1.LoadBalancerIngress objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

表 5-3266 io.k8s.api.core.v1.LoadBalancerIngress

参数	参数类型	描述
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

5.8 VolcanoJob

5.8.1 删除指定 namespace 下的 Volcano Jobs

功能介绍

删除命名空间下的所有Volcano Job。

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs

表 5-3268 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3269 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

响应参数

状态码： 200

表 5-3271 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.

参数	参数类型	描述
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3272 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3273 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3274 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3277 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3278 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of sh.volcano.batch.v1alpha1.Job objects	List of jobs. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

表 5-3279 sh.volcano.batch.v1alpha1.Job

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	status object	Current status of Job

表 5-3280 spec

参数	参数类型	描述
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of spec.tasks objects	Tasks specifies the task specification of Job
volumes	Array of spec.volumes objects	The volumes for Job

表 5-3281 spec.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

参数	参数类型	描述
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3282 spec.tasks

参数	参数类型	描述
name	String	Name specifies the name of tasks
policies	Array of spec.tasks.policies objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3283 spec.tasks.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3284 spec.volumes

参数	参数类型	描述
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.

参数	参数类型	描述
volumeClaim Name	String	The name of the volume claim.

表 5-3285 io.k8s.api.core.v1.PersistentVolumeClaim

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3286 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3287 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3288 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3289 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3290 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3291 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3292 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3293 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3294 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3295 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-3296 status

参数	参数类型	描述
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	status.state object	Current state of Job.
version	Integer	Job's current version

表 5-3297 status.state

参数	参数类型	描述
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

表 5-3298 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.8.3 创建 Volcano Job

功能介绍

创建Volcano Job。

调用方法

请参见[如何调用API](#)。

URI

POST /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs

表 5-3299 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3300 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3301 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3302 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	否	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	否	status object	Current status of Job

表 5-3303 spec

参数	是否必选	参数类型	描述
maxRetry	否	Integer	The limit for retrying submitting job, default is 3
minAvailable	否	Integer	The minimal available pods to run for this Job
plugins	否	Object	Enabled task plugins when creating job.

参数	是否必选	参数类型	描述
policies	否	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	否	String	The name of the queue on which job should be created
schedulerName	否	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	否	Array of spec.tasks objects	Tasks specifies the task specification of Job
volumes	否	Array of spec.volumes objects	The volumes for Job

表 5-3304 spec.policies

参数	是否必选	参数类型	描述
action	否	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	否	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	否	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3305 spec.tasks

参数	是否必选	参数类型	描述
name	否	String	Name specifies the name of tasks
policies	否	Array of spec.tasks.policies objects	Specifies the lifecycle of task

参数	是否必选	参数类型	描述
replicas	否	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	否	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3306 spec.tasks.policies

参数	是否必选	参数类型	描述
action	否	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	否	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	否	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3307 spec.volumes

参数	是否必选	参数类型	描述
mountPath	是	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	否	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	否	String	The name of the volume claim.

表 5-3308 io.k8s.api.core.v1.PersistentVolumeClaim

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	否	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3309 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3310 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3311 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3312 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	是否必选	参数类型	描述
dataSource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	否	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1

参数	是否必选	参数类型	描述
volumeMode	否	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	否	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3313 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-3314 io.k8s.api.core.v1.ResourceRequirements

参数	是否必选	参数类型	描述
limits	否	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	是否必选	参数类型	描述
requests	否	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3315 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	否	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3316 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	key is the label key that the selector applies to.
operator	是	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

参数	是否必选	参数类型	描述
values	否	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3317 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	否	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	否	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	否	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3318 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	是否必选	参数类型	描述
lastProbeTime	否	String	Last time we probed the condition.
lastTransitionTime	否	String	Last time the condition transitioned from one status to another.

参数	是否必选	参数类型	描述
message	否	String	Human-readable message indicating details about last transition.
reason	否	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	是	String	status is the status of the condition.
type	是	String	type is the type of the condition.

表 5-3319 status

参数	是否必选	参数类型	描述
ControlledResources	否	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	否	Integer	The number of pods which reached phase Succeeded.
failed	否	Integer	The number of pods which reached phase Failed.
minAvailable	否	Integer	The minimal available pods to run for this Job
pending	否	Integer	The number of pending pods.
retryCount	否	Integer	The number that volcano retried to submit the job.
running	否	Integer	The number of running pods.
state	否	status.state object	Current state of Job.
version	否	Integer	Job's current version

表 5-3320 status.state

参数	是否必选	参数类型	描述
message	否	String	Human-readable message indicating details about last transition.
phase	否	String	The phase of Job
reason	否	String	Unique, one-word, CamelCase reason for the condition's last transition.

状态码： 200

表 5-3321 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	status object	Current status of Job

表 5-3322 spec

参数	参数类型	描述
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of spec.tasks objects	Tasks specifies the task specification of Job
volumes	Array of spec.volumes objects	The volumes for Job

表 5-3323 spec.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3324 spec.tasks

参数	参数类型	描述
name	String	Name specifies the name of tasks
policies	Array of spec.tasks.policies objects	Specifies the lifecycle of task

参数	参数类型	描述
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3325 spec.tasks.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3326 spec.volumes

参数	参数类型	描述
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

表 5-3327 io.k8s.api.core.v1.PersistentVolumeClaim

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3328 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3329 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3330 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3331 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3332 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3333 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3334 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3335 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3336 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3337 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-3338 status

参数	参数类型	描述
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	status.state object	Current state of Job.
version	Integer	Job's current version

表 5-3339 status.state

参数	参数类型	描述
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

状态码： 201

表 5-3340 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	status object	Current status of Job

表 5-3341 spec

参数	参数类型	描述
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of spec.tasks objects	Tasks specifies the task specification of Job

参数	参数类型	描述
volumes	Array of spec.volumes objects	The volumes for Job

表 5-3342 spec.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3343 spec.tasks

参数	参数类型	描述
name	String	Name specifies the name of tasks
policies	Array of spec.tasks.policies objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3344 spec.tasks.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

参数	参数类型	描述
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3345 spec.volumes

参数	参数类型	描述
mountPath	String	Path within the container at which the volume should be mounted. Must not contain ':'.
volumeClaim	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

表 5-3346 io.k8s.api.core.v1.PersistentVolumeClaim

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

参数	参数类型	描述
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3347 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. 表 5-3359 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	status object	Current status of Job

表 5-3360 spec

参数	参数类型	描述
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of spec.tasks objects	Tasks specifies the task specification of Job

参数	参数类型	描述
volumes	Array of spec.volumes objects	The volumes for Job

表 5-3361 spec.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3362 spec.tasks

参数	参数类型	描述
name	String	Name specifies the name of tasks
policies	Array of spec.tasks.policies objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3363 spec.tasks.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

参数	参数类型	描述
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3364 spec.volumes

参数	参数类型	描述
mountPath	String	Path within the container at which the volume should be mounted. Must not contain ':'.
volumeClaim	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

表 5-3365 io.k8s.api.core.v1.PersistentVolumeClaim

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

参数	参数类型	描述
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3366 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3367 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3368 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3369 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3370 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3371 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3372 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3373 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3374 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3375 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-3376 status

参数	参数类型	描述
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	status.state object	Current state of Job.
version	Integer	Job's current version

表 5-3377 status.state

参数	参数类型	描述
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

请求示例

创建Volcano Job。

```

5.8.4 删除 Volcano Job

功能介绍

删除Volcano Job。

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs/{name}

表 5-3378 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Job
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3379 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

参数	是否必选	参数类型	描述
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3380 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3381 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-3382 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

表 5-3383 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3384 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3385 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3386 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.8.5 查询 Volcano Job 详情

功能介绍

查询Volcano Job的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs/{name}

表 5-3391 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Job
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3392 Query 参数

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3393 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3394 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	status object	Current status of Job

表 5-3395 spec

参数	参数类型	描述
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of spec.tasks objects	Tasks specifies the task specification of Job

参数	参数类型	描述
volumes	Array of spec.volumes objects	The volumes for Job

表 5-3396 spec.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3397 spec.tasks

参数	参数类型	描述
name	String	Name specifies the name of tasks
policies	Array of spec.tasks.policies objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3398 spec.tasks.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

参数	参数类型	描述
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3399 spec.volumes

参数	参数类型	描述
mountPath	String	Path within the container at which the volume should be mounted. Must not contain ':'.
volumeClaim	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

表 5-3400 io.k8s.api.core.v1.PersistentVolumeClaim

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

参数	参数类型	描述
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3401 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3402 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3403 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3404 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3405 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3406 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3407 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3408 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3409 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3410 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-3411 status

参数	参数类型	描述
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	status.state object	Current state of Job.
version	Integer	Job's current version

表 5-3412 status.state

参数	参数类型	描述
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

5.8.6 更新 Volcano Job

功能介绍

更新Volcano Job。

The following fields can be updated:

- metadata.labels
- metadata.generateName
- metadata.annotations
- spec.template
- spec.replicas

调用方法

请参见[如何调用API](#)。

URI

PATCH /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs/{name}

表 5-3413 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Job
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3414 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3415 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	是否必选	参数类型	描述
Content-Type	是	String	<p>目前支持三种类型的PATCH请求方法的操作，参考《使用JSON合并patch更新Deployment》。</p> <ol style="list-style-type: none">1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

表 5-3416 请求 Body 参数

参数	是否必选	参数类型	描述
-	是	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

响应参数

状态码： 200

表 5-3417 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	status object	Current status of Job

表 5-3418 spec

参数	参数类型	描述
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of spec.tasks objects	Tasks specifies the task specification of Job

参数	参数类型	描述
volumes	Array of spec.volumes objects	The volumes for Job

表 5-3419 spec.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3420 spec.tasks

参数	参数类型	描述
name	String	Name specifies the name of tasks
policies	Array of spec.tasks.policies objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3421 spec.tasks.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

参数	参数类型	描述
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3422 spec.volumes

参数	参数类型	描述
mountPath	String	Path within the container at which the volume should be mounted. Must not contain ':'.
volumeClaim	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

表 5-3423 io.k8s.api.core.v1.PersistentVolumeClaim

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

参数	参数类型	描述
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3424 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3425 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3426 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3427 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3428 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3429 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3430 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3431 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3432 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3433 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-3434 status

参数	参数类型	描述
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	status.state object	Current state of Job.
version	Integer	Job's current version

表 5-3435 status.state

参数	参数类型	描述
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

请求示例

更新Volcano Job中的labels值为"app": "patchlabel"。

```
{
  "metadata": {
    "labels": {
      "app": "patchlabel"
    }
  }
}
```

响应示例

状态码: 200

5.8.7 替换 Volcano Job

功能介绍

替换Volcano Job。

The following fields can be updated:

- metadata.labels
- metadata.generateName
- metadata.annotations
- spec.template
- spec.replicas

调用方法

请参见[如何调用API](#)。

URI

PUT /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs/{name}

表 5-3436 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Job
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3437 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3438 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3439 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	否	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	否	status object	Current status of Job

表 5-3440 spec

参数	是否必选	参数类型	描述
maxRetry	否	Integer	The limit for retrying submitting job, default is 3
minAvailable	否	Integer	The minimal available pods to run for this Job
plugins	否	Object	Enabled task plugins when creating job.

参数	是否必选	参数类型	描述
policies	否	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	否	String	The name of the queue on which job should be created
schedulerName	否	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	否	Array of spec.tasks objects	Tasks specifies the task specification of Job
volumes	否	Array of spec.volumes objects	The volumes for Job

表 5-3441 spec.policies

参数	是否必选	参数类型	描述
action	否	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	否	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	否	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3442 spec.tasks

参数	是否必选	参数类型	描述
name	否	String	Name specifies the name of tasks
policies	否	Array of spec.tasks.policies objects	Specifies the lifecycle of task

参数	是否必选	参数类型	描述
replicas	否	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	否	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3443 spec.tasks.policies

参数	是否必选	参数类型	描述
action	否	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	否	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	否	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3444 spec.volumes

参数	是否必选	参数类型	描述
mountPath	是	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '!'.
volumeClaim	否	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	否	String	The name of the volume claim.

表 5-3445 io.k8s.api.core.v1.PersistentVolumeClaim

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	否	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3446 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3447 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3448 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3449 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	是否必选	参数类型	描述
dataSource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	否	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1

参数	是否必选	参数类型	描述
volumeMode	否	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	否	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3450 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-3451 io.k8s.api.core.v1.ResourceRequirements

参数	是否必选	参数类型	描述
limits	否	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	是否必选	参数类型	描述
requests	否	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3452 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	否	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3453 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	key is the label key that the selector applies to.
operator	是	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

参数	是否必选	参数类型	描述
values	否	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3454 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	否	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	否	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	否	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3455 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	是否必选	参数类型	描述
lastProbeTime	否	String	Last time we probed the condition.
lastTransitionTime	否	String	Last time the condition transitioned from one status to another.

参数	是否必选	参数类型	描述
message	否	String	Human-readable message indicating details about last transition.
reason	否	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	是	String	status is the status of the condition.
type	是	String	type is the type of the condition.

表 5-3456 status

参数	是否必选	参数类型	描述
ControlledResources	否	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	否	Integer	The number of pods which reached phase Succeeded.
failed	否	Integer	The number of pods which reached phase Failed.
minAvailable	否	Integer	The minimal available pods to run for this Job
pending	否	Integer	The number of pending pods.
retryCount	否	Integer	The number that volcano retried to submit the job.
running	否	Integer	The number of running pods.
state	否	status.state object	Current state of Job.
version	否	Integer	Job's current version

表 5-3457 status.state

参数	是否必选	参数类型	描述
message	否	String	Human-readable message indicating details about last transition.
phase	否	String	The phase of Job
reason	否	String	Unique, one-word, CamelCase reason for the condition's last transition.

表 5-3458 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata
spec	spec object	Specification of the desired behavior of a cron job, including the minAvailable
status	status object	Current status of Job

表 5-3459 spec

参数	参数类型	描述
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of spec.policies objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of spec.tasks objects	Tasks specifies the task specification of Job
volumes	Array of spec.volumes objects	The volumes for Job

表 5-3460 spec.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3461 spec.tasks

参数	参数类型	描述
name	String	Name specifies the name of tasks
policies	Array of spec.tasks.policies objects	Specifies the lifecycle of task

参数	参数类型	描述
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

表 5-3462 spec.tasks.policies

参数	参数类型	描述
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

表 5-3463 spec.volumes

参数	参数类型	描述
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	io.k8s.api.core.v1.PersistentVolumeClaim object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

表 5-3464 io.k8s.api.core.v1.PersistentVolumeClaim

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-3465 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3466 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3467 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3468 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3469 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3470 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3471 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3472 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3473 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3474 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-3475 status

参数	参数类型	描述
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	status.state object	Current state of Job.
version	Integer	Job's current version

表 5-3476 status.state

参数	参数类型	描述
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

状态码： 201

A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3485 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3486 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3487 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3488 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3489 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3490 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3491 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3492 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-3493 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-3494 status

参数	参数类型	描述
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	status.state object	Current state of Job.
version	Integer	Job's current version

表 5-3495 status.state

参数	参数类型	描述
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

请求示例

将创建的Volcano Job的其中一个task的replicas从1修改为2。

```

5.9 Namespace

5.9.1 查询所有 Namespaces

功能介绍

该API用于获取集群中该用户当前项目下所有Namespace的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces

表 5-3496 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3497 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

表 5-3498 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.core.v1.Namespace objects	Items is the list of Namespace objects in the list. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

表 5-3499 io.k8s.api.core.v1.Namespace

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.NamespaceSpec object	Spec defines the behavior of the Namespace. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.NamespaceStatus object	Status describes the current status of a Namespace. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3500 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3501 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3502 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3503 io.k8s.api.core.v1.NamespaceSpec

参数	参数类型	描述
finalizers	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: https://kubernetes.io/docs/tasks/administer-cluster/namespaces/

表 5-3504 io.k8s.api.core.v1.NamespaceStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.NamespaceCondition objects	Represents the latest available observations of a namespace's current state.
phase	String	Phase is the current lifecycle phase of the namespace. More info: https://kubernetes.io/docs/tasks/administer-cluster/namespaces/

表 5-3505 io.k8s.api.core.v1.NamespaceCondition

参数	参数类型	描述
lastTransitionTime	String	Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	String	
reason	String	
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of namespace controller condition.

表 5-3506 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.9.2 创建 Namespace

功能介绍

创建一个Namespace。

当前云容器实例提供“通用计算型”和“GPU加速型”两种类型的资源，创建命名空间时需要选择资源类型，后续创建的负载中容器就运行在此类型的集群上。调用接口时必须指定metadata.annotations中namespace.kubernetes.io/flavor字段为如下值。

- general-computing: 通用计算型，基本水平的计算、存储和网络资源，适用于通用工作负载场景。
- gpu-accelerated: GPU加速型，突出的图形计算能力，适用于AI等高性能场景。

Namespace下必须要创建一个Network，用于定义kubernetes中一个namespace内的网络与华为云虚拟私有云服务的子网和vpc的映射关系，具体请参见[Namespace和Network](#)。

调用方法

请参见[如何调用API](#)。

URI

POST /api/v1/namespaces

表 5-3507 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3508 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3509 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	是否必选	参数类型	描述
spec	否	io.k8s.api.core.v1.NamespaceSpec object	Spec defines the behavior of the Namespace. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	否	io.k8s.api.core.v1.NamespaceStatus object	Status describes the current status of a Namespace. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3510 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	是否必选	参数类型	描述
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3511 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3512 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3513 io.k8s.api.core.v1.NamespaceSpec

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: https://kubernetes.io/docs/tasks/administer-cluster/namespaces/

表 5-3514 io.k8s.api.core.v1.NamespaceStatus

参数	是否必选	参数类型	描述
conditions	否	Array of io.k8s.api.core.v1.NamespaceCondition objects	Represents the latest available observations of a namespace's current state.
phase	否	String	Phase is the current lifecycle phase of the namespace. More info: https://kubernetes.io/docs/tasks/administer-cluster/namespaces/

表 5-3515 io.k8s.api.core.v1.NamespaceCondition

参数	是否必选	参数类型	描述
lastTransitionTime	否	String	Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	否	String	
reason	否	String	
status	是	String	Status of the condition, one of True, False, Unknown.
type	是	String	Type of namespace controller condition.

Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3518 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3519 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3520 io.k8s.api.core.v1.NamespaceSpec

conditions	Array of io.k8s.api.core.v1.NamespaceCondition objects	Represents the latest available observations of a namespace's current state.
phase	String	Phase is the current lifecycle phase of the namespace. More info: https://kubernetes.io/docs/tasks/administer-cluster/namespaces/

表 5-3522 io.k8s.api.core.v1.NamespaceCondition

参数	参数类型	描述
lastTransitionTime	String	Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	String	
reason	String	
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of namespace controller condition.

状态码: 201

表 5-3523 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.NamespaceSpec object	Spec defines the behavior of the Namespace. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.NamespaceStatus object	Status describes the current status of a Namespace. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3524 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency

5.9.3 删除 Namespace

功能介绍

删除一个Namespace。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{name}

表 5-3537 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Namespace

表 5-3538 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3539 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3540 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-3541 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-3542 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3543 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3544 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3545 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

状态码： 202

表 5-3546 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. 5.9.4 查询 Namespace

功能介绍

查询Namespace的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{name}

表 5-3550 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Namespace

表 5-3551 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3552 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

状态码： 200

表 5-3553 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.NamespaceSpec object	Spec defines the behavior of the Namespace. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.NamespaceStatus object	Status describes the current status of a Namespace. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3554 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3555 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3556 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3557 io.k8s.api.core.v1.NamespaceSpec

参数	参数类型	描述
finalizers	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: https://kubernetes.io/docs/tasks/administer-cluster/namespaces/

表 5-3558 io.k8s.api.core.v1.NamespaceStatus

参数	参数类型	描述
conditions	Array of io.k8s.api.core.v1.NamespaceCondition objects	Represents the latest available observations of a namespace's current state.
phase	String	Phase is the current lifecycle phase of the namespace. More info: https://kubernetes.io/docs/tasks/administer-cluster/namespaces/

表 5-3559 io.k8s.api.core.v1.NamespaceCondition

参数	参数类型	描述
lastTransitionTime	String	Time is a wrapper around time. Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	String	
reason	String	
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of namespace controller condition.

5.10 ClusterRole

5.10.1 获取 ClusterRole 列表

功能介绍

This API is used to list or watch objects of kind ClusterRole

调用方法

请参见[如何调用API](#)。

URI

GET /apis/rbac.authorization.k8s.io/v1/clusterroles

表 5-3560 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3561 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3562 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.rbac.v1.ClusterRole objects	Items is a list of ClusterRoles
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard object's metadata.

表 5-3563 io.k8s.api.rbac.v1.ClusterRole

参数	参数类型	描述
aggregationRule	io.k8s.api.rbac.v1.AggregationRule object	AggregationRule is an optional field that describes how to build the Rules for this ClusterRole. If AggregationRule is set, then the Rules are controller managed and direct changes to Rules will be stomped by the controller.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata.
rules	Array of io.k8s.api.rbac.v1.PolicyRule objects	Rules holds all the PolicyRules for this ClusterRole

表 5-3564 io.k8s.api.rbac.v1.AggregationRule

参数	参数类型	描述
clusterRoleSelectors	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector objects	ClusterRoleSelectors holds a list of selectors which will be used to find ClusterRoles and create the rules. If any of the selectors match, then the ClusterRole's permissions will be added

表 5-3565 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3566 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3567 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3568 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3569 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3570 io.k8s.api.rbac.v1.PolicyRule

参数	参数类型	描述
apiGroups	Array of strings	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed.

参数	参数类型	描述
nonResourceURLs	Array of strings	NonResourceURLs is a set of partial urls that a user should have access to. *s are allowed, but only as the full, final step in the path Since non-resource URLs are not namespaced, this field is only applicable for ClusterRoles referenced from a ClusterRoleBinding. Rules can either apply to API resources (such as "pods" or "secrets") or non-resource URL paths (such as "/api"), but not both.
resourceNames	Array of strings	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed.
resources	Array of strings	Resources is a list of resources this rule applies to. ResourceAll represents all resources.
verbs	Array of strings	Verbs is a list of Verbs that apply to ALL the ResourceKinds and AttributeRestrictions contained in this rule. VerbAll represents all kinds.

表 5-3571 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3580 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3581 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3582 io.k8s.api.rbac.v1.PolicyRule

参数	参数类型	描述
apiGroups	Array of strings	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed.

参数	参数类型	描述
nonResourceURLs	Array of strings	NonResourceURLs is a set of partial urls that a user should have access to. *s are allowed, but only as the full, final step in the path Since non-resource URLs are not namespaced, this field is only applicable for ClusterRoles referenced from a ClusterRoleBinding. Rules can either apply to API resources (such as "pods" or "secrets") or non-resource URL paths (such as "/api"), but not both.
resourceNames	Array of strings	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed.
resources	Array of strings	Resources is a list of resources this rule applies to. ResourceAll represents all resources.
verbs	Array of strings	Verbs is a list of Verbs that apply to ALL the ResourceKinds and AttributeRestrictions contained in this rule. VerbAll represents all kinds.

5.11 Secret

5.11.1 删除指定 namespace 下的 Secrets

功能介绍

删除Namespace下所有Secret。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/secrets

表 5-3583 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3584 Query 参数

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

参数	是否必选	参数类型	描述
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3585 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3586 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-3587 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-3588 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3589 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3590 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3591 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.11.2 查询指定 namespace 下的 Secrets

功能介绍

查询指定namespace下的所有Secret对象。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/secrets

表 5-3592 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3593 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3594 请求 Header 参数

表 5-3595 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.core.v1.Secret objects	Items is a list of secret objects. More info: https://kubernetes.io/docs/concepts/configuration/secret
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

表 5-3596 io.k8s.api.core.v1.Secret

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in https://tools.ietf.org/html/rfc4648#section-4

参数	参数类型	描述
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

表 5-3597 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3598 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3599 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3600 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.11.3 创建 Secret

功能介绍

创建Secret, Kubernetes提供了Secret来处理敏感信息。

调用方法

请参见[如何调用API](#)。

URI

POST /api/v1/namespaces/{namespace}/secrets

表 5-3601 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3602 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

参数	是否必选	参数类型	描述
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3603 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3604 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	是否必选	参数类型	描述
data	否	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in https://tools.ietf.org/html/rfc4648#section-4
immutable	否	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by <code>ImmutableEphemeralVolumes</code> feature gate.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
stringData	否	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.

参数	是否必选	参数类型	描述
type	否	String	Used to facilitate programmatic handling of secret data.

They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3610 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3611 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

状态码： 201

表 5-3612 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in https://tools.ietf.org/html/rfc4648#section-4
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

表 5-3613 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. 5.11.4 删除 Secret

功能介绍

删除Secret。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/secrets/{name}

表 5-3620 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Secret
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3621 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

参数	是否必选	参数类型	描述
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3622 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3623 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

参数	是否必选	参数类型	描述
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.

参数	是否必选	参数类型	描述
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-3624 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-3625 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.

参数	参数类型	描述
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3626 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.

参数	参数类型	描述
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3627 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3628 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

状态码： 202

表 5-3629 响应 Body 参数

5.11.5 查询 Secret

功能介绍

查询Secret的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/secrets/{name}

表 5-3633 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Secret
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3634 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3635 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3636 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in https://tools.ietf.org/html/rfc4648#section-4
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

表 5-3637 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3638 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3639 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

5.11.6 更新 Secret

功能介绍

更新Secret中部分信息。

调用方法

请参见[如何调用API](#)。

URI

PATCH /api/v1/namespaces/{namespace}/secrets/{name}

表 5-3640 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Secret
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3641 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	否	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3642 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	目前支持三种类型的PATCH请求方法的操作，参考《 使用JSON合并patch更新Deployment 》。 <ol style="list-style-type: none">1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

表 5-3643 请求 Body 参数

参数	是否必选	参数类型	描述
-	是	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

响应参数

状态码： 200

表 5-3644 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in https://tools.ietf.org/html/rfc4648#section-4
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

表 5-3645 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3646 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3647 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

请求示例

更新Secret中的数据为"test2" : "dGVzdA=="。

Content-Type: application/merge-patch+json

```
{
  "data": {
    "test2": "dGVzdA=="
  }
}
```

响应示例

状态码: 200

OK

```
{
  "apiVersion": "v1",
  "data": {
    "key1": "MWYyZDFIMmU2N2Rm",
    "key2": "YWRtaW4=",
    "test2": "dGVzdA=="
  },
  "kind": "Secret",
  "metadata": {
    "creationTimestamp": "2018-09-04T03:59:19Z",
    "name": "secret-test",
    "namespace": "namespace-test",
    "resourceVersion": "5199399",
    "selfLink": "/api/v1/namespaces/namespace-test/secrets/secret-test",
    "uid": "e6170b6d-aff6-11e8-8f17-c81fbe371a17"
  },
  "type": "Opaque"
}
```

5.11.7 替换 Secret

功能介绍

替换Secret。

其中以下字段支持更新：

- metadata.labels
- metadata.annotations
- data

说明

说明：

- 当“type”的值为“Opaque”时，“data”的“key”和“value”都可以更新。
- 当“type”的值不为“Opaque”时，“data”的“value”可以更新。

调用方法

请参见[如何调用API](#)。

URI

PUT /api/v1/namespaces/{namespace}/secrets/{name}

表 5-3648 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Secret
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3649 Query 参数

参数	是否必选	参数类型	描述

type	String	Used to facilitate programmatic handling of secret data.

表 5-3656 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3657 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3658 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

状态码： 201

表 5-3659 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in https://tools.ietf.org/html/rfc4648#section-4
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

5.12 Endpoint

5.12.1 查询指定 namespace 下的 Endpoints

功能介绍

查询Namespace下所有Endpoints。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/endpoints

表 5-3663 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3664 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3665 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
subsets	Array of io.k8s.api.core.v1.EndpointSubset objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

表 5-3668 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3669 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3670 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3671 io.k8s.api.core.v1.EndpointSubset

参数	参数类型	描述
addresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	参数类型	描述
notReadyAddresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of io.k8s.api.core.v1.EndpointPort objects	Port numbers available on the related IP addresses.

表 5-3672 io.k8s.api.core.v1.EndpointAddress

参数	参数类型	描述
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	io.k8s.api.core.v1.ObjectReference object	Reference to object providing the endpoint.

表 5-3673 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.

参数	参数类型	描述
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3674 io.k8s.api.core.v1.EndpointPort

参数	参数类型	描述
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and http://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

参数	参数类型	描述
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

表 5-3675 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.12.2 创建 Endpoint

功能介绍

创建Endpoint。

调用方法

请参见[如何调用API](#)。

URI

POST /api/v1/namespaces/{namespace}/endpoints

表 5-3676 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3677 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3678 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3679 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
subsets	否	Array of io.k8s.api.core.v1.EndpointSubset objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

表 5-3680 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3681 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3682 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3683 io.k8s.api.core.v1.EndpointSubset

参数	是否必选	参数类型	描述
addresses	否	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	是否必选	参数类型	描述
notReadyAddresses	否	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	否	Array of io.k8s.api.core.v1.EndpointPort objects	Port numbers available on the related IP addresses.

表 5-3684 io.k8s.api.core.v1.EndpointAddress

参数	是否必选	参数类型	描述
hostname	否	String	The Hostname of this endpoint
ip	是	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	否	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	否	io.k8s.api.core.v1.ObjectReference object	Reference to object providing the endpoint.

表 5-3685 io.k8s.api.core.v1.ObjectReference

参数	是否必选	参数类型	描述
apiVersion	否	String	API version of the referent.

参数	是否必选	参数类型	描述
fieldPath	否	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	否	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	否	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	否	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency

参数	是否必选	参数类型	描述
uid	否	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3686 io.k8s.api.core.v1.EndpointPort

参数	是否必选	参数类型	描述
appProtocol	否	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Un-prefixed names are reserved for IANA standard service names (as per RFC-6335 and http://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as mycompany.com/my-custom-protocol. This is a beta field that is guarded by the ServiceAppProtocol feature gate and enabled by default.
name	否	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	是	Integer	The port number of the endpoint.
protocol	否	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

表 5-3687 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
subsets	Array of io.k8s.api.core.v1.EndpointSubset objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

表 5-3688 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3689 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3690 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3691 io.k8s.api.core.v1.EndpointSubset

参数	参数类型	描述
addresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	参数类型	描述
notReadyAddresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of io.k8s.api.core.v1.EndpointPort objects	Port numbers available on the related IP addresses.

表 5-3692 io.k8s.api.core.v1.EndpointAddress

参数	参数类型	描述
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	io.k8s.api.core.v1.ObjectReference object	Reference to object providing the endpoint.

表 5-3693 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.

参数	参数类型	描述
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3694 io.k8s.api.core.v1.EndpointPort

参数	参数类型	描述
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and http://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

参数	参数类型	描述
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3705 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3706 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3707 io.k8s.api.core.v1.EndpointSubset

参数	参数类型	描述
addresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	参数类型	描述
notReadyAddresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of io.k8s.api.core.v1.EndpointPort objects	Port numbers available on the related IP addresses.

表 5-3708 io.k8s.api.core.v1.EndpointAddress

参数	参数类型	描述
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	io.k8s.api.core.v1.ObjectReference object	Reference to object providing the endpoint.

表 5-3709 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.

参数	参数类型	描述
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3710 io.k8s.api.core.v1.EndpointPort

参数	参数类型	描述
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and http://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

参数	参数类型	描述
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

请求示例

创建Endpoint，端口名称为"service0"，端口号"80"，端口的IP协议为默认的TCP协议。

```

5.12.3 删除 Endpoint

功能介绍

删除Endpoint。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/endpoints/{name}

表 5-3711 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Endpoints
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3712 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3713 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3714 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-3715 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

表 5-3716 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3717 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3718 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3719 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.12.4 查询 Endpoint

功能介绍

查询Endpoint。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/endpoints/{name}

表 5-3724 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Endpoints
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3725 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3726 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3727 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
subsets	Array of io.k8s.api.core.v1.EndpointSubset objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

表 5-3728 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3729 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3730 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3731 io.k8s.api.core.v1.EndpointSubset

参数	参数类型	描述
addresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	参数类型	描述
notReadyAddresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of io.k8s.api.core.v1.EndpointPort objects	Port numbers available on the related IP addresses.

表 5-3732 io.k8s.api.core.v1.EndpointAddress

参数	参数类型	描述
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	io.k8s.api.core.v1.ObjectReference object	Reference to object providing the endpoint.

表 5-3733 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.

参数	参数类型	描述
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3734 io.k8s.api.core.v1.EndpointPort

参数	参数类型	描述
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and http://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

参数	参数类型	描述
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

5.12.5 更新 Endpoint

功能介绍

更新Endpoint。

调用方法

请参见[如何调用API](#)。

URI

PATCH /api/v1/namespaces/{namespace}/endpoints/{name}

表 5-3735 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Endpoints
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3736 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	否	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3737 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	是否必选	参数类型	描述
Content-Type	是	String	<p>目前支持三种类型的PATCH请求方法的操作，参考《使用JSON合并patch更新Deployment》。</p> <ol style="list-style-type: none">1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

表 5-3738 请求 Body 参数

参数	是否必选	参数类型	描述
-	是	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

响应参数

状态码： 200

表 5-3739 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
subsets	Array of io.k8s.api.core.v1.EndpointSubset objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

表 5-3740 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3741 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3742 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3743 io.k8s.api.core.v1.EndpointSubset

参数	参数类型	描述
addresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	参数类型	描述
notReadyAddresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of io.k8s.api.core.v1.EndpointPort objects	Port numbers available on the related IP addresses.

表 5-3744 io.k8s.api.core.v1.EndpointAddress

参数	参数类型	描述
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	io.k8s.api.core.v1.ObjectReference object	Reference to object providing the endpoint.

表 5-3745 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.

参数	参数类型	描述
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3746 io.k8s.api.core.v1.EndpointPort

参数	参数类型	描述
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and http://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

参数	参数类型	描述
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

请求示例

更新Endpoint。

```
[{
  "op": "add",
  "path": "/metadata/annotations",
  "value": {
    "test-key": "test-value"
  }
}]
```

响应示例

5.12.6 替换 Endpoint

功能介绍

替换Endpoint。

调用方法

请参见[如何调用API](#)。

URI

PUT /api/v1/namespaces/{namespace}/endpoints/{name}

表 5-3747 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Endpoints
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3748 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3749 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3750 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
subsets	否	Array of io.k8s.api.core.v1.EndpointSubset objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

表 5-3751 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3752 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3753 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3754 io.k8s.api.core.v1.EndpointSubset

参数	是否必选	参数类型	描述
addresses	否	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	是否必选	参数类型	描述
notReadyAddresses	否	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	否	Array of io.k8s.api.core.v1.EndpointPort objects	Port numbers available on the related IP addresses.

表 5-3755 io.k8s.api.core.v1.EndpointAddress

参数	是否必选	参数类型	描述
hostname	否	String	The Hostname of this endpoint
ip	是	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	否	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	否	io.k8s.api.core.v1.ObjectReference object	Reference to object providing the endpoint.

表 5-3756 io.k8s.api.core.v1.ObjectReference

参数	是否必选	参数类型	描述
apiVersion	否	String	API version of the referent.

参数	是否必选	参数类型	描述
fieldPath	否	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	否	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	否	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	否	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency

参数	是否必选	参数类型	描述
uid	否	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3757 io.k8s.api.core.v1.EndpointPort

参数	是否必选	参数类型	描述
appProtocol	否	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Un-prefixed names are reserved for IANA standard service names (as per RFC-6335 and http://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as mycompany.com/my-custom-protocol. This is a beta field that is guarded by the ServiceAppProtocol feature gate and enabled by default.
name	否	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	是	Integer	The port number of the endpoint.
protocol	否	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3760 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3761 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3762 io.k8s.api.core.v1.EndpointSubset

参数	参数类型	描述
addresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

参数	参数类型	描述
notReadyAddresses	Array of io.k8s.api.core.v1.EndpointAddress objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of io.k8s.api.core.v1.EndpointPort objects	Port numbers available on the related IP addresses.

表 5-3763 io.k8s.api.core.v1.EndpointAddress

参数	参数类型	描述
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	io.k8s.api.core.v1.ObjectReference object	Reference to object providing the endpoint.

表 5-3764 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.

参数	参数类型	描述
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3765 io.k8s.api.core.v1.EndpointPort

参数	参数类型	描述
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and http://www.iana.org/assignments/service-names). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

参数	参数类型	描述
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

状态码： 201

表 5-3766 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
subsets	Array of io.k8s.api.core.v1.EndpointSubset objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

表 5-3767 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

5.13 ResourceQuota

5.13.1 查询指定 namespace 下的 resourcequotas

功能介绍

查询指定namespace下的resourcequotas（资源用量）。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/resourcequotas

表 5-3774 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3775 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3776 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

items	Array of io.k8s.api.core.v1.ResourceQuota objects	Items is a list of ResourceQuota objects. More info: https://kubernetes.io/docs/concepts/policy/resource-quotas/
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

表 5-3778 io.k8s.api.core.v1.ResourceQuota

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.ResourceQuotaSpec object	Spec defines the desired quota. https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.core.v1.ResourceQuotaStatus object	Status defines the actual enforced quota and its current usage. https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3779 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3780 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3781 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3782 io.k8s.api.core.v1.ResourceQuotaSpec

参数	参数类型	描述
hard	Map<String,String>	hard is the set of desired hard limits for each named resource. More info: https://kubernetes.io/docs/concepts/policy/resource-quotas/

参数	参数类型	描述
scopeSelector	io.k8s.api.core.v1.ScopeSelector object	scopeSelector is also a collection of filters like scopes that must match each object tracked by a quota but expressed using ScopeSelectorOperator in combination with possible values. For a resource to match, both scopes AND scopeSelector (if specified in spec), must be matched.
scopes	Array of strings	A collection of filters that must match each object tracked by a quota. If not specified, the quota matches all objects.

表 5-3783 io.k8s.api.core.v1.ScopeSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.ScopedResourceSelectorRequirement objects	A list of scope selector requirements by scope of the resources.

表 5-3784 io.k8s.api.core.v1.ScopedResourceSelectorRequirement

参数	参数类型	描述
operator	String	Represents a scope's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist.
scopeName	String	The name of the scope that the selector applies to.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3785 io.k8s.api.core.v1.ResourceQuotaStatus

参数	参数类型	描述
hard	Map<String,String>	Hard is the set of enforced hard limits for each named resource. More info: https://kubernetes.io/docs/concepts/policy/resource-quotas/
used	Map<String,String>	Used is the current observed total usage of the resource in the namespace.

表 5-3786 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.13.2 查询指定的 resourcequota

功能介绍

查询指定的resourcequota（资源用量）。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/resourcequotas/{name}

表 5-3787 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the ResourceQuota
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3788 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.

参数	是否必选	参数类型	描述
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3789 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3790 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3792 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3793 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3794 io.k8s.api.core.v1.ResourceQuotaSpec

参数	参数类型	描述
hard	Map<String,String>	hard is the set of desired hard limits for each named resource. More info: https://kubernetes.io/docs/concepts/policy/resource-quotas/

参数	参数类型	描述
scopeSelector	io.k8s.api.core.v1.ScopeSelector object	scopeSelector is also a collection of filters like scopes that must match each object tracked by a quota but expressed using ScopeSelectorOperator in combination with possible values. For a resource to match, both scopes AND scopeSelector (if specified in spec), must be matched.
scopes	Array of strings	A collection of filters that must match each object tracked by a quota. If not specified, the quota matches all objects.

表 5-3795 io.k8s.api.core.v1.ScopeSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.ScopedResourceSelectorRequirement objects	A list of scope selector requirements by scope of the resources.

表 5-3796 io.k8s.api.core.v1.ScopedResourceSelectorRequirement

参数	参数类型	描述
operator	String	Represents a scope's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist.
scopeName	String	The name of the scope that the selector applies to.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3797 io.k8s.api.core.v1.ResourceQuotaStatus

参数	参数类型	描述
hard	Map<String,String>	Hard is the set of enforced hard limits for each named resource. More info: https://kubernetes.io/docs/concepts/policy/resource-quotas/
used	Map<String,String>	Used is the current observed total usage of the resource in the namespace.

5.14 CronJob

5.14.1 查询所有 namespace 下的 CronJobs

功能介绍

查询所有namespace下所有CronJob的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/batch/v1beta1/cronjobs

表 5-3798 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	否	String	If 'true', then the output is pretty printed.

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

请求参数

表 5-3799 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3800 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.batch.v1beta1.CronJob objects	items is the list of CronJobs.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

表 5-3801 io.k8s.api.batch.v1beta1.CronJob

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.batch.v1beta1.CronJobSpec object	Specification of the desired behavior of a cron job, including the schedule. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status
status	io.k8s.api.batch.v1beta1.CronJobStatus object	Current status of a cron job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3802 io.k8s.api.batch.v1beta1.CronJobSpec

参数	参数类型	描述
concurrencyPolicy	String	Specifies how to treat concurrent executions of a Job. Valid values are: - "Allow" (default): allows CronJobs to run concurrently; - "Forbid": forbids concurrent runs, skipping next run if previous run hasn't finished yet; - "Replace": cancels currently running job and replaces it with a new one
failedJobsHistoryLimit	Integer	The number of failed finished jobs to retain. This is a pointer to distinguish between explicit zero and not specified. Defaults to 1.
jobTemplate	io.k8s.api.batch.v1beta1.JobTemplateSpec object	Specifies the job that will be created when executing a CronJob.
schedule	String	The schedule in Cron format, see https://en.wikipedia.org/wiki/Cron .
startingDeadlineSeconds	Long	Optional deadline in seconds for starting the job if it misses scheduled time for any reason. Missed jobs executions will be counted as failed ones.
successfulJobsHistoryLimit	Integer	The number of successful finished jobs to retain. This is a pointer to distinguish between explicit zero and not specified. Defaults to 3.

参数	参数类型	描述
suspend	Boolean	This flag tells the controller to suspend subsequent executions, it does not apply to already started executions. Defaults to false.

表 5-3803 io.k8s.api.batch.v1beta1.JobTemplateSpec

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata of the jobs created from this template. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.batch.v1.JobSpec object	Specification of the desired behavior of the job. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3804 io.k8s.api.batch.v1.JobSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer
backoffLimit	Integer	Specifies the number of retries before marking this job failed. Defaults to 6
completions	Integer	Specifies the desired number of successfully finished pods the job should be run with. Setting to nil means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/

参数	参数类型	描述
manualSelector or	Boolean	manualSelector controls generation of pod labels and pod selectors. Leave <i>manualSelector</i> unset unless you are certain what you are doing. When false or unset, the system pick labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see <i>manualSelector=true</i> in jobs that were created with the old <i>extensions/v1beta1</i> API. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector
parallelism	Integer	Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when $((.spec.completions - .status.successful) < .spec.parallelism)$, i.e. when the work left to do is less than max parallelism. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over pods that should match the pod count. Normally, the system sets this field for you. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors
template	io.k8s.api.core.v1.PodTemplateSpec object	Describes the pod that will be created when executing a job. More info: https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/
ttlSecondsAfterFinished	Integer	ttlSecondsAfterFinished limits the lifetime of a Job that has finished execution (either Complete or Failed). If this field is set, ttlSecondsAfterFinished after the Job finishes, it is eligible to be automatically deleted. When the Job is being deleted, its lifecycle guarantees (e.g. finalizers) will be honored. If this field is unset, the Job won't be automatically deleted. If this field is set to zero, the Job becomes eligible to be deleted immediately after it finishes. This field is alpha-level and is only honored by servers that enable the TTLAfterFinished feature.

表 5-3805 io.k8s.api.core.v1.PodTemplateSpec

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3806 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.

参数	参数类型	描述
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod

参数	参数类型	描述
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-3807 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-3808 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-3809 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-3810 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-3811 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-3812 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-3813 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-3814 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-3815 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-3816 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-3817 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-3818 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-3819 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-3820 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-3821 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-3822 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-3823 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-3824 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-3825 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-3826 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-3827 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-3828 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-3829 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-3830 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-3831 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-3832 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-3833 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-3834 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-3835 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-3836 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-3837 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-3838 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-3839 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-3840 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-3841 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '/'. Must not contain '..'. Must not contain '%'. Must not contain '*'. Must not contain '?'. Must not contain '['. Must not contain ']'. Must not contain '&'. Must not contain '='. Must not contain '". Must not contain ''.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-3842 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-3843 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-3844 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-3845 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-3846 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-3847 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-3848 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-3849 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-3850 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-3851 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-3852 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-3853 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-3854 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-3855 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-3856 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-3857 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-3858 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-3859 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-3860 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-3861 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-3862 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-3863 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-3864 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3865 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3866 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3867 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-3868 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-3869 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-3870 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-3871 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-3872 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-3873 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.

参数	参数类型	描述
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-3874 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-3875 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-3876 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-3877 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-3878 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-3879 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication

参数	参数类型	描述
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-3880 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-3881 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-3882 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-3883 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-3884 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-3885 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-3886 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-3887 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-3888 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-3889 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-3890 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-3891 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-3892 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-3893 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-3894 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-3895 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-3896 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-3897 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-3898 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-3899 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-3900 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-3901 io.k8s.api.batch.v1beta1.CronJobStatus

参数	参数类型	描述
active	Array of io.k8s.api.core.v1.ObjectReference objects	A list of pointers to currently running jobs.
lastScheduleTime	String	Information when was the last time the job was successfully scheduled.

表 5-3902 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.

参数	参数类型	描述
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3903 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

表 5-3905 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
serverAddressByClientCIDRs	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-Ip header or request.RemoteAddr (in that order) to get the client IP.

参数	参数类型	描述
versions	Array of strings	versions are the api versions that are available.

表 5-3906 io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

参数	参数类型	描述
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

状态码： 200

表 5-3908 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
groupVersion	String	groupVersion is the group and version this APIResourceList is for.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
resources	Array of io.k8s.apimachinery.pkg.apis.meta.v1.APIResource objects	resources contains the name of the resources and if they are namespaced.

表 5-3909 io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

参数	参数类型	描述
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.

参数	参数类型	描述
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

5.15.4 查询 APIGroup /apis/apps

功能介绍

查询APIGroup /apis/apps

调用方法

请参见[如何调用API](#)。

URI

GET /apis/apps

请求参数

表 5-3915 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3916 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	name is the name of the group.
preferredVersion	io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery object	preferredVersion is the version preferred by the API server, which probably is the storage version.

参数	参数类型	描述
serverAddressByClientCIDRs	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-Ip header or request.RemoteAddr (in that order) to get the client IP.
versions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery objects	versions are the versions supported in this group.

表 5-3917 io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery

参数	参数类型	描述
groupVersion	String	groupVersion specifies the API group and version in the form "group/version"
version	String	version specifies the version in the form of "version". This is to save the clients the trouble of splitting the GroupVersion.

表 5-3918 io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

参数	参数类型	描述
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

5.15.5 查询所有 apps/v1 的 API

功能介绍

get available resources

调用方法

请参见[如何调用API](#)。

URI

GET /apis/apps/v1

请求参数

表 5-3919 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3920 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
groupVersion	String	groupVersion is the group and version this APIResourceList is for.

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
resources	Array of io.k8s.apimachinery.pkg.apis.meta.v1.APIResource objects	resources contains the name of the resources and if they are namespaced.

表 5-3921 io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

参数	参数类型	描述
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.

参数	参数类型	描述
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

resources	Array of io.k8s.apimachinery.pkg.apis.meta.v1.APIResource objects	resources contains the name of the resources and if they are namespaced.

表 5-3938 io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

参数	参数类型	描述
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.

参数	参数类型	描述
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

GET /apis/crd.yangtse.cni

请求参数

表 5-3939 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3940 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	name is the name of the group.
preferredVersion	io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery object	preferredVersion is the version preferred by the API server, which probably is the storage version.
serverAddressByClientCIDRs	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-Ip header or request.RemoteAddr (in that order) to get the client IP.

参数	参数类型	描述
versions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery objects	versions are the versions supported in this group.

表 5-3941 io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery

参数	参数类型	描述
groupVersion	String	groupVersion specifies the API group and version in the form "group/version"
version	String	version specifies the version in the form of "version". This is to save the clients the trouble of splitting the GroupVersion.

表 5-3942 io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

参数	参数类型	描述
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

preferredVersion	io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery object	preferredVersion is the version preferred by the API server, which probably is the storage version.

参数	参数类型	描述
serverAddressByClientCIDRs	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-Ip header or request.RemoteAddr (in that order) to get the client IP.
versions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery objects	versions are the versions supported in this group.

表 5-3962 io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery

参数	参数类型	描述
groupVersion	String	groupVersion specifies the API group and version in the form "group/version"
version	String	version specifies the version in the form of "version". This is to save the clients the trouble of splitting the GroupVersion.

表 5-3963 io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

参数	参数类型	描述
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

调用方法

请参见[如何调用API](#)。

URI

GET /apis/networking.cci.io/v1beta1

请求参数

表 5-3964 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-3965 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
groupVersion	String	groupVersion is the group and version this APIResourceList is for.

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
resources	Array of io.k8s.apimachinery.pkg.apis.meta.v1.APIResource objects	resources contains the name of the resources and if they are namespaced.

表 5-3966 io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

参数	参数类型	描述
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.

参数	参数类型	描述
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

5.16 Event

5.16.1 查询指定 namespace 下的 Events

功能介绍

查询Namespace下所有Event的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/events

表 5-3974 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3975 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3976 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

表 5-3977 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.core.v1.Event objects	List of events
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

表 5-3978 io.k8s.api.core.v1.Event

参数	参数类型	描述
action	String	What action was taken/failed regarding to the Regarding object.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
count	Integer	The number of times this event has occurred.
eventTime	String	Time when this Event was first observed.

参数	参数类型	描述
firstTimestamp	String	The time at which the event was first recorded. (Time of server receipt is in TypeMeta.)
involvedObject	io.k8s.api.core.v1.ObjectReference object	The object that this event is about.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
lastTimestamp	String	The time at which the most recent occurrence of this event was recorded.
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
reason	String	This should be a short, machine understandable string that gives the reason for the transition into the object's current status.
related	io.k8s.api.core.v1.ObjectReference object	Optional secondary object for more complex actions.
reportingComponent	String	Name of the controller that emitted this Event, e.g. <i>kubernetes.io/kubelet</i> .
reportingInstance	String	ID of the controller instance, e.g. <i>kubelet-xyzf</i> .
series	io.k8s.api.core.v1.EventSeries object	Data about the Event series this event represents or nil if it's a singleton Event.
source	io.k8s.api.core.v1.EventSource object	The component reporting this event. Should be a short machine understandable string.
type	String	Type of this event (Normal, Warning), new types could be added in the future

表 5-3979 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-3980 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-3981 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3982 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.

参数	参数类型	描述
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-3983 io.k8s.api.core.v1.EventSeries

参数	参数类型	描述
count	Integer	Number of occurrences in this series up to the last heartbeat time
lastObservedTime	String	Time of the last occurrence observed

表 5-3984 io.k8s.api.core.v1.EventSource

参数	参数类型	描述
component	String	Component from which the event is generated.
host	String	Node name on which the event is generated.

表 5-3985 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.16.2 删除 Event

功能介绍

删除Event。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/events/{name}

表 5-3986 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Event
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-3987 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

参数	是否必选	参数类型	描述
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-3988 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-3989 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-3990 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

表 5-3991 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-3992 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-3993 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-3994 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.16.3 查询 Event

功能介绍

查询Event详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/events/{name}

表 5-3999 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the Event
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4000 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4001 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-4002 响应 Body 参数

参数	参数类型	描述
action	String	What action was taken/failed regarding to the Regarding object.

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
count	Integer	The number of times this event has occurred.
eventTime	String	Time when this Event was first observed.
firstTimestamp	String	The time at which the event was first recorded. (Time of server receipt is in TypeMeta.)
involvedObject	io.k8s.api.core.v1.ObjectReference object	The object that this event is about.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
lastTimestamp	String	The time at which the most recent occurrence of this event was recorded.
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
reason	String	This should be a short, machine understandable string that gives the reason for the transition into the object's current status.
related	io.k8s.api.core.v1.ObjectReference object	Optional secondary object for more complex actions.
reportingComponent	String	Name of the controller that emitted this Event, e.g. <i>kubernetes.io/kubelet</i> .
reportingInstance	String	ID of the controller instance, e.g. <i>kubelet-xyzf</i> .

参数	参数类型	描述
series	io.k8s.api.core.v1.EventSeries object	Data about the Event series this event represents or nil if it's a singleton Event.
source	io.k8s.api.core.v1.EventSource object	The component reporting this event. Should be a short machine understandable string.
type	String	Type of this event (Normal, Warning), new types could be added in the future

表 5-4003 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-4004 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4005 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4006 io.k8s.api.core.v1.ObjectReference

参数	参数类型	描述
apiVersion	String	API version of the referent.

参数	参数类型	描述
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
namespace	String	Namespace of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
uid	String	UID of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids

表 5-4007 io.k8s.api.core.v1.EventSeries

参数	参数类型	描述
count	Integer	Number of occurrences in this series up to the last heartbeat time
lastObservedTime	String	Time of the last occurrence observed

表 5-4008 io.k8s.api.core.v1.EventSource

参数	参数类型	描述
component	String	Component from which the event is generated.
host	String	Node name on which the event is generated.

5.17 PersistentVolumeClaim

5.17.1 查询指定 namespace 下的 PersistentVolumeClaims

功能介绍

查询Namespace下的所有PersistentVolumeClaim。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/persistentvolumeclaims

表 5-4009 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4010 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4011 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-4015 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4016 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4017 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4018 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-4019 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4020 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4021 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4022 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4023 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-4024 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.17.2 创建 PersistentVolumeClaim

功能介绍

创建PersistentVolumeClaim，主要适用于动态创建存储的场景，即存储资源未创建时，创建PVC会根据请求内容创建一个存储资源。

当前支持创建EVS（云硬盘卷，块存储）和SFS（文件存储卷），使用时spec.storageClassName参数的取值如下：

- sata：普通I/O云硬盘卷
- sas：高I/O云硬盘卷
- ssd：超高I/O云硬盘卷

- csi-disk-gpssd: 通用型SSD云硬盘卷
- csi-disk-gpssd2: 通用型SSD V2云硬盘卷
- nfs-rw: 标准文件协议类型文件存储卷
- csi-sfs: SFS 3.0容量型弹性文件服务
- csi-sfsturbo-hpc: HPC型弹性文件服务

若不指定spec.storageClassName, 可在metadata.annotations中指定volume.beta.kubernetes.io/storage-class, 取值含义与spec.storageClassName 相同, 这两个参数选择其中一个即可。

若需要创建加密类型存储卷, 对于云硬盘存储卷需要在metadata.annotations中增加paas.storage.io/cryptKeyId字段; 对于文件存储卷需要增加paas.storage.io/cryptKeyId、paas.storage.io/cryptAlias和paas.storage.io/cryptDomainId字段。

若需要创建通用型SSD V2云硬盘卷, 卷需要在metadata.annotations中增加everest.io/disk-iops 和 everest.io/disk-throughput 字段, IOPS和吞吐量大小范围可见EVS文档。

调用方法

请参见[如何调用API](#)。

URI

POST /api/v1/namespaces/{namespace}/persistentvolumeclaims

表 5-4025 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4026 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

参数	是否必选	参数类型	描述
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4027 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4028 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	是否必选	参数类型	描述
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	否	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4029 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	是否必选	参数类型	描述
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4030 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4031 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4032 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	是否必选	参数类型	描述
dataSource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	否	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1

参数	是否必选	参数类型	描述
volumeMode	否	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	否	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4033 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-4034 io.k8s.api.core.v1.ResourceRequirements

参数	是否必选	参数类型	描述
limits	否	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	是否必选	参数类型	描述
requests	否	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4035 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	否	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4036 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	key is the label key that the selector applies to.
operator	是	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

参数	是否必选	参数类型	描述
values	否	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4037 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	否	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	否	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	否	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4038 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	是否必选	参数类型	描述
lastProbeTime	否	String	Last time we probed the condition.
lastTransitionTime	否	String	Last time the condition transitioned from one status to another.

参数	是否必选	参数类型	描述
message	否	String	Human-readable message indicating details about last transition.
reason	否	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	是	String	status is the status of the condition.
type	是	String	type is the type of the condition.

表 5-4039 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4040 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-4041 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4042 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4043 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4044 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-4045 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4046 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4047 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4048 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4049 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4059 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4060 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

状态码： 202

表 5-4061 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4062 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-4063 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4064 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4065 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4066 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-4067 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4068 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4069 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4070 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4071 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

请求示例

- 创建一个大小为10G的加密云硬盘，类型为sata

```

5.17.3 删除 PersistentVolumeClaim

功能介绍

删除PersistentVolumeClaim。

调用方法

请参见[如何调用API](#)。

URI

DELETE /api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}

表 5-4072 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the PersistentVolumeClaim
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4073 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

参数	是否必选	参数类型	描述
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4074 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4075 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-4076 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4078 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-4079 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4080 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4081 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4082 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-4083 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4084 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4085 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4086 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4087 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

状态码： 202

表 5-4088 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4089 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. 5.17.4 查询 PersistentVolumeClaim

功能介绍

查询PersistentVolumeClaim。

调用方法

请参见[如何调用API](#)。

URI

GET /api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}

表 5-4099 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the PersistentVolumeClaim

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4100 Query 参数

参数	是否必选	参数类型	描述
exact	否	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	否	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4101 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-4102 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4103 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4104 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4105 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4106 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4107 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-4108 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4109 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4110 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4111 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4112 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

5.17.5 替换 PersistentVolumeClaims

功能介绍

替换指定PersistentVolumeClaims。

其中以下字段支持更新：

- metadata.labels
- metadata.annotations
- metadata.generateName 其余部分不支持更新。

调用方法

请参见[如何调用API](#)。

URI

PUT /api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}

表 5-4113 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the PersistentVolumeClaim
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4114 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4115 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

参数	是否必选	参数类型	描述
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4116 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

参数	是否必选	参数类型	描述
status	否	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4117 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	是否必选	参数类型	描述
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4118 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4119 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4120 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	是否必选	参数类型	描述
dataSource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	否	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1

参数	是否必选	参数类型	描述
volumeMode	否	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	否	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4121 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-4122 io.k8s.api.core.v1.ResourceRequirements

参数	是否必选	参数类型	描述
limits	否	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	是否必选	参数类型	描述
requests	否	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4123 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	否	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4124 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	key is the label key that the selector applies to.
operator	是	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

参数	是否必选	参数类型	描述
values	否	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4125 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	否	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	否	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	否	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4126 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	是否必选	参数类型	描述
lastProbeTime	否	String	Last time we probed the condition.
lastTransitionTime	否	String	Last time the condition transitioned from one status to another.

参数	是否必选	参数类型	描述
message	否	String	Human-readable message indicating details about last transition.
reason	否	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	是	String	status is the status of the condition.
type	是	String	type is the type of the condition.

表 5-4127 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4128 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4142 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4143 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-4144 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4145 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4146 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4147 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4148 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

5.18 RoleBinding

5.18.1 获取指定 namespace 下 RoleBinding 列表

功能介绍

This API is used to list or watch objects of kind RoleBinding

调用方法

请参见[如何调用API](#)。

URI

GET /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings

表 5-4149 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4150 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4151 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-4152 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.rbac.v1.RoleBinding objects	Items is a list of RoleBindings
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard object's metadata.

表 5-4153 io.k8s.api.rbac.v1.RoleBinding

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata.
roleRef	io.k8s.api.rbac.v1.RoleRef object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of io.k8s.api.rbac.v1.Subject objects	Subjects holds references to the objects the role applies to.

表 5-4154 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4155 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4156 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4157 io.k8s.api.rbac.v1.RoleRef

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

参数	参数类型	描述
name	String	Name is the name of resource being referenced

表 5-4158 io.k8s.api.rbac.v1.Subject

参数	参数类型	描述
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

表 5-4159 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

URI

POST /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings

表 5-4160 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4161 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4162 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4163 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata.

参数	是否必选	参数类型	描述
roleRef	是	io.k8s.api.rbac.v1.RoleRef object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	否	Array of io.k8s.api.rbac.v1.Subject objects	Subjects holds references to the objects the role applies to.

表 5-4164 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	是否必选	参数类型	描述
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4165 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4166 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4167 io.k8s.api.rbac.v1.RoleRef

参数	是否必选	参数类型	描述
apiGroup	是	String	APIGroup is the group for the resource being referenced
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-4168 io.k8s.api.rbac.v1.Subject

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	是	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	是	String	Name of the object being referenced.
namespace	否	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-4177 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4178 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4179 io.k8s.api.rbac.v1.RoleRef

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

参数	参数类型	描述
name	String	Name is the name of resource being referenced

表 5-4180 io.k8s.api.rbac.v1.Subject

参数	参数类型	描述
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

状态码： 202

表 5-4181 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata.
roleRef	io.k8s.api.rbac.v1.RoleRef object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of io.k8s.api.rbac.v1.Subject objects	Subjects holds references to the objects the role applies to.

表 5-4182 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-4185 io.k8s.api.rbac.v1.RoleRef

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

参数	参数类型	描述
name	String	Name is the name of resource being referenced

表 5-4186 io.k8s.api.rbac.v1.Subject

参数	参数类型	描述
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

请求示例

创建RoleBinding，将"rbac-test"命名空间中的用户组绑定到名称为"view"的ClusterRole下。

```
{
  "apiVersion": "rbac.authorization.k8s.io/v1",
  "kind": "RoleBinding",
  "metadata": {
    "name": "clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
    "namespace": "rbac-test"
  },
  "roleRef": {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "ClusterRole",
    "name": "view"
  },
  "subjects": [ {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "User",
    "name": "07b82a44a680d5661f01c00b448f8f50"
  } ]
}
```

响应示例

5.18.3 删除指定的 RoleBinding

功能介绍

This API is used to delete a RoleBinding

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}

表 5-4187 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the RoleBinding
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4188 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4189 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4190 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-4191 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-4192 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-4193 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4194 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-4195 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

状态码： 202

表 5-4196 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-4197 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.

参数	参数类型	描述
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4198 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-4199 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.18.4 获取指定的 RoleBinding

功能介绍

This API is used to read the specified RoleBinding

调用方法

请参见[如何调用API](#)。

URI

GET /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}

表 5-4200 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the RoleBinding
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4201 Query 参数

参数	是否必选	参数类型	描述
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4202 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-4203 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata.
roleRef	io.k8s.api.rbac.v1.RoleRef object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of io.k8s.api.rbac.v1.Subject objects	Subjects holds references to the objects the role applies to.

表 5-4204 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	参数类型	描述
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested. Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4205 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4206 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4207 io.k8s.api.rbac.v1.RoleRef

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

参数	参数类型	描述
name	String	Name is the name of resource being referenced

表 5-4208 io.k8s.api.rbac.v1.Subject

参数	参数类型	描述
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

5.18.5 更新指定的 RoleBinding

功能介绍

This API is used to partially update the specified RoleBinding

调用方法

请参见[如何调用API](#)。

URI

PATCH /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}

表 5-4209 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the RoleBinding
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4210 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	否	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4211 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	目前支持三种类型的PATCH请求方法的操作，参考《 使用JSON合并patch更新Deployment 》。 <ol style="list-style-type: none">1. Json Patch, Content-Type: application/json-patch+json 在RFC6902协议的定义中，Json Patch包含一系列对目标JSON对象的操作，其本身也为JSON对象。服务器接收到该对象后，会将其表示的操作应用于目标JSON对象。2. Merge Patch, Content-Type: application/merge-patch+json 在RFC7386协议的定义中，Merge Patch必须包含对一个资源对象的部分描述，即为JSON对象。该JSON对象被提交到服务端后与服务端的当前对象合并，即替换当前资源对象中的列表域，从而创建一个新的对象。3. Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json Strategic Merge Patch是添加合法的元数据到API对象中，并通过这些新的元数据来决定哪个列表被合并，哪个列表不该被合并。当前这些元数据则作为结构标签。

表 5-4212 请求 Body 参数

参数	是否必选	参数类型	描述
-	是	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

响应参数

表 5-4215 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4216 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4217 io.k8s.api.rbac.v1.RoleRef

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

参数	参数类型	描述
name	String	Name is the name of resource being referenced

表 5-4218 io.k8s.api.rbac.v1.Subject

参数	参数类型	描述
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

请求示例

更新指定的RoleBinding。

```
{
  "roleRef": {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "ClusterRole",
    "name": "view"
  },
  "subjects": [ {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "User",
    "name": "07b82a44a680d5661f01c00b448f8f50"
  }, {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "Group",
    "name": "07b8387fd080d2963f92c00bb9a7341e"
  } ]
}
```

响应示例

5.18.6 替换指定的 RoleBinding

功能介绍

This API is used to replace the specified RoleBinding

调用方法

请参见[如何调用API](#)。

URI

PUT /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}

表 5-4219 路径参数

参数	是否必选	参数类型	描述
name	是	String	name of the RoleBinding
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4220 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4221 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4222 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata.

参数	是否必选	参数类型	描述
roleRef	是	io.k8s.api.rbac.v1.RoleRef object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	否	Array of io.k8s.api.rbac.v1.Subject objects	Subjects holds references to the objects the role applies to.

表 5-4223 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	是否必选	参数类型	描述
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	否	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4224 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4225 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4226 io.k8s.api.rbac.v1.RoleRef

参数	是否必选	参数类型	描述
apiGroup	是	String	APIGroup is the group for the resource being referenced
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-4227 io.k8s.api.rbac.v1.Subject

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	是	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	是	String	Name of the object being referenced.
namespace	否	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata.
roleRef	io.k8s.api.rbac.v1.RoleRef object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of io.k8s.api.rbac.v1.Subject objects	Subjects holds references to the objects the role applies to.

表 5-4235 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata

参数	参数类型	描述
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources. Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4236 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4237 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4238 io.k8s.api.rbac.v1.RoleRef

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

参数	参数类型	描述
name	String	Name is the name of resource being referenced

表 5-4239 io.k8s.api.rbac.v1.Subject

参数	参数类型	描述
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

5.18.7 获取 RoleBinding 列表

功能介绍

This API is used to list or watch objects of kind RoleBinding

调用方法

请参见[如何调用API](#)。

URI

GET /apis/rbac.authorization.k8s.io/v1/rolebindings

表 5-4240 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	否	String	If 'true', then the output is pretty printed.

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

请求参数

表 5-4241 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-4242 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.rbac.v1.RoleBinding objects	Items is a list of RoleBindings
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard object's metadata.

name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

表 5-4249 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.19 StatefulSet

5.19.1 删除指定 namespace 下的 StatefulSets

功能介绍

删除Namespace下所有StatefulSet。

调用方法

请参见[如何调用API](#)。

URI

DELETE /apis/apps/v1/namespaces/{namespace}/statefulsets

表 5-4250 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4251 Query 参数

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	否	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset

参数	是否必选	参数类型	描述
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4252 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4253 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
dryRun	否	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	否	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
orphanDependents	否	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	否	io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	否	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

表 5-4254 io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

参数	是否必选	参数类型	描述
resourceVersion	否	String	Specifies the target ResourceVersion
uid	否	String	Specifies the target UID.

响应参数

状态码： 200

表 5-4255 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
message	String	A human-readable description of the status of this operation.
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	Standard list metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-4256 io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

参数	参数类型	描述
causes	Array of io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none">for those errors this field may indicate how long to wait before taking the alternate action.
uid	String	UID of the resource. (when there is a single resource which can be described). More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4257 io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

参数	参数类型	描述
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

参数	参数类型	描述
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

表 5-4258 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

参数	参数类型	描述
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

请求示例

- 只删除StatefulSet（对应Pod不删除）

```
{
  "Kind": "DeleteOptions",
  "apiVersion": "v1",
  "propagationPolicy": "Orphan"
}
```

- 前台级联删除（按照Pod->StatefulSet的顺序进行删除）

```
{
  "apiVersion": "v1",
  "kind": "DeleteOptions",
  "propagationPolicy": "Foreground"
}
```

- 后台级联删除（按照StatefulSet->Pod的顺序进行删除）

```
{
  "apiVersion": "v1",
  "kind": "DeleteOptions",
  "propagationPolicy": "Background"
}
```

响应示例

状态码： 200

OK

```
{
  "apiVersion": "apps/v1",
  "items": null,

5.19.2 查询指定 namespace 下的 StatefulSets

功能介绍

查询Namespace下所有StatefulSet的详细信息。

调用方法

请参见[如何调用API](#)。

URI

GET /apis/apps/v1/namespaces/{namespace}/statefulsets

表 5-4259 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4260 Query 参数

参数	是否必选	参数类型	描述
allowWatchBookmarks	否	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

参数	是否必选	参数类型	描述
continue	否	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	否	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	否	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

参数	是否必选	参数类型	描述
limit	否	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

参数	是否必选	参数类型	描述
resourceVersion	否	String	resourceVersion sets a constraint on what resource versions a request may be served from. See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
resourceVersionMatch	否	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions for details. Defaults to unset
timeoutSeconds	否	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	否	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4261 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。

响应参数

状态码： 200

表 5-4262 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
items	Array of io.k8s.api.apps.v1.StatefulSet objects	StatefulSet represents a set of pods with consistent identities. Identities are defined as: <ul style="list-style-type: none">• Network: A single stable DNS and hostname.• Storage: As many VolumeClaims as requested. The StatefulSet guarantees that a given network identity will always map to the same storage identity.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta object	ListMeta describes metadata that synthetic resources must have, including lists and various status objects. A resource may have only one of {ObjectMeta, ListMeta}.

表 5-4263 io.k8s.api.apps.v1.StatefulSet

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources

参数	参数类型	描述
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	io.k8s.api.apps.v1.StatefulSetSpec object	Spec defines the desired identities of pods in this set.
status	io.k8s.api.apps.v1.StatefulSetStatus object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

表 5-4264 io.k8s.api.apps.v1.StatefulSetSpec

参数	参数类型	描述
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.

参数	参数类型	描述
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	io.k8s.api.core.v1.PodTemplateSpec object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	io.k8s.api.apps.v1.StatefulSetUpdateStrategy object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of io.k8s.api.core.v1.PersistentVolumeClaim objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

表 5-4265 io.k8s.api.core.v1.PodTemplateSpec

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-4266 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.

参数	参数类型	描述
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod

参数	参数类型	描述
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-4267 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-4268 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-4269 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-4270 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-4271 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-4272 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-4273 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-4274 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-4275 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-4276 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-4277 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-4278 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-4279 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-4280 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-4281 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-4282 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-4283 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-4284 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-4285 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-4286 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-4287 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-4288 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-4289 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-4290 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-4291 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-4292 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-4293 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-4294 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-4295 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-4296 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-4297 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-4298 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-4299 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-4300 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-4301 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '/'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-4302 io.k8s.api.core.v1.Policy

参数	参数类型	描述
logs	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-4303 io.k8s.api.core.v1.Logs

参数	参数类型	描述
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-4304 io.k8s.api.core.v1.PodReadinessGate

参数	参数类型	描述
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-4305 io.k8s.api.core.v1.PodSecurityContext

参数	参数类型	描述
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

参数	参数类型	描述
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-4306 io.k8s.api.core.v1.SELinuxOptions

参数	参数类型	描述
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

表 5-4307 io.k8s.api.core.v1.SeccompProfile

参数	参数类型	描述
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-4308 io.k8s.api.core.v1.Sysctl

参数	参数类型	描述
name	String	Name of a property to set
value	String	Value of a property to set

表 5-4309 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	参数类型	描述
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-4310 io.k8s.api.core.v1.Toleration

参数	参数类型	描述
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-4311 io.k8s.api.core.v1.TopologySpreadConstraint

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	参数类型	描述
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-4312 io.k8s.api.core.v1.Volume

参数	参数类型	描述
awsElasticBlockStore	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
azureDisk	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	参数类型	描述
ephemeral	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	io.k8s.api.core.v1.FCVolumeSource object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

参数	参数类型	描述
gitRepo	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
iscsi	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

参数	参数类型	描述
portworxVolume	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API
quobyte	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-4313 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-4314 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	参数类型	描述
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-4315 io.k8s.api.core.v1.AzureFileVolumeSource

参数	参数类型	描述
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

表 5-4316 io.k8s.api.core.v1.CephFSVolumeSource

参数	参数类型	描述
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-4317 io.k8s.api.core.v1.CinderVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-4318 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-4319 io.k8s.api.core.v1.CSIVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-4320 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-4321 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	参数类型	描述
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-4322 io.k8s.api.core.v1.EphemeralVolumeSource

参数	参数类型	描述
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	参数类型	描述
volumeClaimTemplate	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i><pod name>-<volume name></i> where <i><volume name></i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-4323 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-4324 io.k8s.api.core.v1.FCVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-4325 io.k8s.api.core.v1.FlexVolumeSource

参数	参数类型	描述
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-4326 io.k8s.api.core.v1.FlockerVolumeSource

参数	参数类型	描述
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-4327 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-4328 io.k8s.api.core.v1.GitRepoVolumeSource

参数	参数类型	描述
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

表 5-4329 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	参数类型	描述
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-4330 io.k8s.api.core.v1.HostPathVolumeSource

参数	参数类型	描述
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-4331 io.k8s.api.core.v1.ISCSIVolumeSource

参数	参数类型	描述
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-4332 io.k8s.api.core.v1.LocalDirVolumeSource

参数	参数类型	描述
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

参数	参数类型	描述
		will cause implementors to also use a fixed point implementation.

表 5-4333 io.k8s.api.core.v1.NFSVolumeSource

参数	参数类型	描述
path	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-4334 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	参数类型	描述
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-4335 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

表 5-4336 io.k8s.api.core.v1.PortworxVolumeSource

参数	参数类型	描述
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

表 5-4337 io.k8s.api.core.v1.ProjectedVolumeSource

参数	参数类型	描述
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-4338 io.k8s.api.core.v1.VolumeProjection

参数	参数类型	描述
configMap	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project

参数	参数类型	描述
secret	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-4339 io.k8s.api.core.v1.ConfigMapProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-4340 io.k8s.api.core.v1.DownwardAPIProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-4341 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	参数类型	描述
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-4342 io.k8s.api.core.v1.ObjectFieldSelector

参数	参数类型	描述
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

表 5-4343 io.k8s.api.core.v1.ResourceFieldSelector

参数	参数类型	描述
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

表 5-4344 io.k8s.api.core.v1.SecretProjection

参数	参数类型	描述
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-4345 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	参数类型	描述
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

表 5-4346 io.k8s.api.core.v1.QuobyteVolumeSource

参数	参数类型	描述
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

表 5-4347 io.k8s.api.core.v1.RBDVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	参数类型	描述
pool	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-4348 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

参数	参数类型	描述
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-4349 io.k8s.api.core.v1.SecretVolumeSource

参数	参数类型	描述
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-4350 io.k8s.api.core.v1.KeyToPath

参数	参数类型	描述
key	String	The key to project.

参数	参数类型	描述
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-4351 io.k8s.api.core.v1.StorageOSVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-4352 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	参数类型	描述
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

表 5-4353 io.k8s.api.apps.v1.StatefulSetUpdateStrategy

参数	参数类型	描述
rollingUpdate	io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

表 5-4354 io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

参数	参数类型	描述
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

表 5-4355 io.k8s.api.core.v1.PersistentVolumeClaim

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4356 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	参数类型	描述
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations

参数	参数类型	描述
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	参数类型	描述
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	参数类型	描述
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server. If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header). Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

参数	参数类型	描述
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels
managedFields	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces
ownerReferences	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

参数	参数类型	描述
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids</p>

表 5-4357 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	参数类型	描述
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

参数	参数类型	描述
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4358 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	参数类型	描述
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4359 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	参数类型	描述
dataSource	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4360 io.k8s.api.core.v1.TypedLocalObjectReference

参数	参数类型	描述
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

表 5-4361 io.k8s.api.core.v1.ResourceRequirements

参数	参数类型	描述
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4362 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	参数类型	描述
matchExpressions	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4363 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	参数类型	描述
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4364 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	参数类型	描述
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4365 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	参数类型	描述
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

参数	参数类型	描述
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

表 5-4366 io.k8s.api.apps.v1.StatefulSetStatus

参数	参数类型	描述
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of io.k8s.api.apps.v1.StatefulSetCondition objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

参数	参数类型	描述
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

表 5-4367 io.k8s.api.apps.v1.StatefulSetCondition

参数	参数类型	描述
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

表 5-4368 io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

参数	参数类型	描述
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

参数	参数类型	描述
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

5.19.3 创建 StatefulSet

功能介绍

创建StatefulSet。

调用方法

请参见[如何调用API](#)。

URI

POST /apis/apps/v1/namespaces/{namespace}/statefulsets

表 5-4369 路径参数

参数	是否必选	参数类型	描述
namespace	是	String	object name and auth scope, such as for teams and projects

表 5-4370 Query 参数

参数	是否必选	参数类型	描述
dryRun	否	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	否	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by https://golang.org/pkg/unicode/#IsPrint .
pretty	否	String	If 'true', then the output is pretty printed.

请求参数

表 5-4371 请求 Header 参数

参数	是否必选	参数类型	描述
X-Auth-Token	是	String	用户Token。 通过调用IAM服务获取用户Token接口获取（响应消息头中X-Subject-Token的值）。
Content-Type	是	String	消息体的类型（格式），默认取值为“application/json” 缺省值： application/json

表 5-4372 请求 Body 参数

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	否	io.k8s.api.apps.v1.StatefulSetSpec object	Spec defines the desired identities of pods in this set.
status	否	io.k8s.api.apps.v1.StatefulSetStatus object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

表 5-4373 io.k8s.api.apps.v1.StatefulSetSpec

参数	是否必选	参数类型	描述
podManagementPolicy	否	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	否	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	否	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	是	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors

参数	是否必选	参数类型	描述
serviceName	是	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	是	io.k8s.api.core.v1.PodTemplateSpec object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	否	io.k8s.api.apps.v1.StatefulSetUpdateStrategy object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	否	Array of io.k8s.api.core.v1.PersistentVolumeClaim objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

表 5-4374 io.k8s.api.core.v1.PodTemplateSpec

参数	是否必选	参数类型	描述
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-4375 io.k8s.api.core.v1.PodSpec

参数	是否必选	参数类型	描述
activeDeadlineSeconds	否	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	否	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	否	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	是	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	否	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.

参数	是否必选	参数类型	描述
dnsPolicy	否	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	否	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	否	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	否	Array of io.k8s.api.core.v1.HostAliases objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	否	Boolean	Use the host's ipc namespace. Optional: Default to false.

参数	是否必选	参数类型	描述
hostNetwork	否	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	否	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	否	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	否	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod

参数	是否必选	参数类型	描述
initContainers	否	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	否	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	否	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	是否必选	参数类型	描述
overhead	否	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	否	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.

参数	是否必选	参数类型	描述
priority	否	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	否	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	否	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md
restartPolicy	否	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy

参数	是否必选	参数类型	描述
runtimeClassName	否	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	否	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	否	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	否	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	否	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/

参数	是否必选	参数类型	描述
setHostnameAsFQDN	否	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	否	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	否	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.

参数	是否必选	参数类型	描述
terminationGracePeriodSeconds	否	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	否	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	否	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	否	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-4376 io.k8s.api.core.v1.Affinity

参数	是否必选	参数类型	描述
nodeAffinity	否	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	是否必选	参数类型	描述
podAffinity	否	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	否	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-4377 io.k8s.api.core.v1.NodeAffinity

参数	是否必选	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	否	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

参数	是否必选	参数类型	描述
requiredDuringSchedulingIgnoredDuringExecution	否	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-4378 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	是否必选	参数类型	描述
preference	是	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.
weight	是	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-4379 io.k8s.api.core.v1.NodeSelectorTerm

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	否	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-4380 io.k8s.api.core.v1.NodeSelector

参数	是否必选	参数类型	描述
nodeSelectorTerms	是	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-4381 io.k8s.api.core.v1.NodeSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	The label key that the selector applies to.
operator	是	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.
values	否	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-4382 io.k8s.api.core.v1.PodAffinity

参数	是否必选	参数类型	描述
<code>preferredDuringSchedulingIgnoredDuringExecution</code>	否	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, <code>requiredDuringSchedulingIgnoredDuringExecution</code> affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding <code>podAffinityTerm</code> ; the node(s) with the highest sum are the most preferred.
<code>requiredDuringSchedulingIgnoredDuringExecution</code>	否	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each <code>podAffinityTerm</code> are intersected, i.e. all terms must be satisfied.

表 5-4383 io.k8s.api.core.v1.PodAntiAffinity

参数	是否必选	参数类型	描述
<code>preferredDuringSchedulingIgnoredDuringExecution</code>	否	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, <code>requiredDuringSchedulingIgnoredDuringExecution</code> anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding <code>podAffinityTerm</code> ; the node(s) with the highest sum are the most preferred.
<code>requiredDuringSchedulingIgnoredDuringExecution</code>	否	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each <code>podAffinityTerm</code> are intersected, i.e. all terms must be satisfied.

表 5-4384 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	是否必选	参数类型	描述
podAffinityTerm	是	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	是	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-4385 io.k8s.api.core.v1.PodAffinityTerm

参数	是否必选	参数类型	描述
labelSelector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	否	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	是	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-4386 io.k8s.api.core.v1.PodDNSConfig

参数	是否必选	参数类型	描述
nameservers	否	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	否	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	否	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-4387 io.k8s.api.core.v1.PodDNSConfigOption

参数	是否必选	参数类型	描述
name	否	String	Required.
value	否	String	value is the value of the option

表 5-4388 io.k8s.api.core.v1.EphemeralContainer

参数	是否必选	参数类型	描述
args	否	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, ie: \$ \$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	否	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$ \$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	否	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.

参数	是否必选	参数类型	描述
envFrom	否	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	否	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images
imagePullPolicy	否	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	否	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	是	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	否	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.

参数	是否必选	参数类型	描述
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	否	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	否	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	否	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	否	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

参数	是否必选	参数类型	描述
targetContainerName	否	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	否	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	否	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	否	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	是否必选	参数类型	描述
volumeDevices	否	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	否	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	否	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-4389 io.k8s.api.core.v1.HostAlias

参数	是否必选	参数类型	描述
hostnames	否	Array of strings	Hostnames for the above IP address.
ip	否	String	IP address of the host file entry.

表 5-4390 io.k8s.api.core.v1.LocalObjectReference

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-4391 io.k8s.api.core.v1.Container

参数	是否必选	参数类型	描述
args	否	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$ (VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$ (VAR_NAME) syntax can be escaped with a double \$\$, ie: \$ \$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	否	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$ \$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	否	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.

参数	是否必选	参数类型	描述
envFrom	否	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	否	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	否	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	否	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	否	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

参数	是否必选	参数类型	描述
name	是	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	否	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	否	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/management-compute-resources-container/
securityContext	否	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/

参数	是否必选	参数类型	描述
startupProbe	否	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	否	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	否	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

参数	是否必选	参数类型	描述
terminationMessagePath	否	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	否	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	否	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	否	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	否	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.

参数	是否必选	参数类型	描述
workingDir	否	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-4392 io.k8s.api.core.v1.EnvVar

参数	是否必选	参数类型	描述
name	是	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	否	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	否	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-4393 io.k8s.api.core.v1.EnvVarSource

参数	是否必选	参数类型	描述
configMapKeyRef	否	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.

参数	是否必选	参数类型	描述
fieldRef	否	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports metadata.name, metadata.namespace, <i>metadata.labels['<KEY>']</i> , <i>metadata.annotations['<KEY>']</i> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
resourceFieldRef	否	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	否	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-4394 io.k8s.api.core.v1.ConfigMapKeySelector

参数	是否必选	参数类型	描述
key	是	String	The key to select.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-4395 io.k8s.api.core.v1.SecretKeySelector

参数	是否必选	参数类型	描述
key	是	String	The key of the secret to select from. Must be a valid secret key.

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret or its key must be defined

表 5-4396 io.k8s.api.core.v1.EnvFromSource

参数	是否必选	参数类型	描述
configMapRef	否	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	否	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	否	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-4397 io.k8s.api.core.v1.ConfigMapEnvSource

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap must be defined

表 5-4398 io.k8s.api.core.v1.SecretEnvSource

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret must be defined

表 5-4399 io.k8s.api.core.v1.Lifecycle

参数	是否必选	参数类型	描述
postStart	否	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

参数	是否必选	参数类型	描述
preStop	否	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-4400 io.k8s.api.core.v1.Handler

参数	是否必选	参数类型	描述
exec	否	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	否	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
tcpSocket	否	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-4401 io.k8s.api.core.v1.ContainerPort

参数	是否必选	参数类型	描述
containerPort	是	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	否	String	What host IP to bind the external port to.
hostPort	否	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	否	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	否	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-4402 io.k8s.api.core.v1.SecurityContext

参数	是否必选	参数类型	描述
allowPrivilegeEscalation	否	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN

参数	是否必选	参数类型	描述
capabilities	否	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	否	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.
procMount	否	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	否	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	否	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	否	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

参数	是否必选	参数类型	描述
runAsUser	否	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	否	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	否	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.
windowsOptions	否	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-4403 io.k8s.api.core.v1.Capabilities

参数	是否必选	参数类型	描述
add	否	Array of strings	Added capabilities
drop	否	Array of strings	Removed capabilities

表 5-4404 io.k8s.api.core.v1.Probe

参数	是否必选	参数类型	描述
exec	否	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	否	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	否	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	否	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	否	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	否	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	否	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	否	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-4405 io.k8s.api.core.v1.ExecAction

参数	是否必选	参数类型	描述
command	否	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-4406 io.k8s.api.core.v1.HTTPGetAction

参数	是否必选	参数类型	描述
host	否	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	否	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	否	String	Path to access on the HTTP server.
port	是	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	否	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-4407 io.k8s.api.core.v1.HTTPHeader

参数	是否必选	参数类型	描述
name	是	String	The header field name

参数	是否必选	参数类型	描述
value	是	String	The header field value

表 5-4408 io.k8s.api.core.v1.TCPSocketAction

参数	是否必选	参数类型	描述
host	否	String	Optional: Host name to connect to, defaults to the pod IP.
port	是	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-4409 io.k8s.api.core.v1.VolumeDevice

参数	是否必选	参数类型	描述
devicePath	是	String	devicePath is the path inside of the container that the device will be mapped to.
name	是	String	name must match the name of a persistentVolumeClaim in the pod

表 5-4410 io.k8s.api.core.v1.VolumeMount

参数	是否必选	参数类型	描述
extendPathMode	否	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	是	String	Path within the container at which the volume should be mounted. Must not contain '!'.

参数	是否必选	参数类型	描述
mountPropagation	否	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	是	String	This must match the Name of a Volume.
policy	否	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	否	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	否	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	否	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$ (VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

表 5-4411 io.k8s.api.core.v1.Policy

参数	是否必选	参数类型	描述
logs	否	io.k8s.api.core.v1.Logs object	Logs describes log Volume and its rotate strategy.

表 5-4412 io.k8s.api.core.v1.Logs

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations for log.
rotate	是	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

表 5-4413 io.k8s.api.core.v1.PodReadinessGate

参数	是否必选	参数类型	描述
conditionType	是	String	ConditionType refers to a condition in the pod's condition list with matching type.

表 5-4414 io.k8s.api.core.v1.PodSecurityContext

参数	是否必选	参数类型	描述
fsGroup	否	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none">1. The owning GID will be the FSGroup2. The setgid bit is set (new files created in the volume will be owned by FSGroup)3. The permission bits are OR'd with rw-rw---- <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>

参数	是否必选	参数类型	描述
fsGroupChangePolicy	否	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	否	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	否	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

参数	是否必选	参数类型	描述
runAsUser	否	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seLinuxOptions	否	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	否	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by the containers in this pod.
supplementalGroups	否	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	否	Array of io.k8s.api.core.v1.Sysctl objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	否	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-4415 io.k8s.api.core.v1.SELinuxOptions

参数	是否必选	参数类型	描述
level	否	String	Level is SELinux level label that applies to the container.
role	否	String	Role is a SELinux role label that applies to the container.
type	否	String	Type is a SELinux type label that applies to the container.
user	否	String	User is a SELinux user label that applies to the container.

表 5-4416 io.k8s.api.core.v1.SeccompProfile

参数	是否必选	参数类型	描述
localhostProfile	否	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	是	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

表 5-4417 io.k8s.api.core.v1.Sysctl

参数	是否必选	参数类型	描述
name	是	String	Name of a property to set
value	是	String	Value of a property to set

表 5-4418 io.k8s.api.core.v1.WindowsSecurityContextOptions

参数	是否必选	参数类型	描述
gmsaCredentialSpec	否	String	GMSACredentialSpec is where the GMSA admission webhook (https://github.com/kubernetes-sigs/windows-gmsa) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
gmsaCredentialSpecName	否	String	<code>GMSACredentialSpecName</code> is the name of the GMSA credential spec to use.
runAsUserName	否	String	The <code>UserName</code> in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in <code>PodSecurityContext</code> . If set in both <code>SecurityContext</code> and <code>PodSecurityContext</code> , the value specified in <code>SecurityContext</code> takes precedence.

表 5-4419 io.k8s.api.core.v1.Toleration

参数	是否必选	参数类型	描述
effect	否	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are <code>NoSchedule</code> , <code>PreferNoSchedule</code> and <code>NoExecute</code> .
key	否	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be <code>Exists</code> ; this combination means to match all values and all keys.

参数	是否必选	参数类型	描述
operator	否	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	否	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	否	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

表 5-4420 io.k8s.api.core.v1.TopologySpreadConstraint

参数	是否必选	参数类型	描述
labelSelector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

参数	是否必选	参数类型	描述
maxSkew	是	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0: zone1 zone2 zone3 P P - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1 (zone2) would make the ActualSkew(2-0) on zone1 (zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	是	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.

参数	是否必选	参数类型	描述
whenUnsatisfiable	是	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1: zone1 zone2 zone3 P P P P P If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

表 5-4421 io.k8s.api.core.v1.Volume

参数	是否必选	参数类型	描述
awsElasticBlockStore	否	io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

参数	是否必选	参数类型	描述
azureDisk	否	io.k8s.api.core.v1.AzureDiskVolumeSource object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	否	io.k8s.api.core.v1.AzureFileVolumeSource object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	否	io.k8s.api.core.v1.CephFSVolumeSource object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	否	io.k8s.api.core.v1.CinderVolumeSource object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
configMap	否	io.k8s.api.core.v1.ConfigMapVolumeSource object	ConfigMap represents a configMap that should populate this volume
csi	否	io.k8s.api.core.v1.CSIVolumeSource object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	否	io.k8s.api.core.v1.DownwardAPIVolumeSource object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	否	io.k8s.api.core.v1.EmptyDirVolumeSource object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir

参数	是否必选	参数类型	描述
ephemeral	否	io.k8s.api.core.v1.EphemeralVolumeSource object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	否	io.k8s.api.core.v1.FCVolumeSource object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>

参数	是否必选	参数类型	描述
flexVolume	否	io.k8s.api.core.v1.FlexVolumeSource object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	否	io.k8s.api.core.v1.FlockerVolumeSource object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	否	io.k8s.api.core.v1.GCEPersistentDiskVolumeSource object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
gitRepo	否	io.k8s.api.core.v1.GitRepoVolumeSource object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	否	io.k8s.api.core.v1.GlusterfsVolumeSource object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/glusterfs/README.md
hostPath	否	io.k8s.api.core.v1.HostPathVolumeSource object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

参数	是否必选	参数类型	描述
iscsi	否	io.k8s.api.core.v1.ISCSIVolumeSource object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: https://examples.k8s.io/volumes/iscsi/README.md
localDir	否	io.k8s.api.core.v1.LocalDirVolumeSource object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	是	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
nfs	否	io.k8s.api.core.v1.NFSVolumeSource object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
persistentVolumeClaim	否	io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
photonPersistentDisk	否	io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
portworxVolume	否	io.k8s.api.core.v1.PortworxVolumeSource object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	否	io.k8s.api.core.v1.ProjectedVolumeSource object	Items for all in one resources secrets, configmaps, and downward API

参数	是否必选	参数类型	描述
quobyte	否	io.k8s.api.core.v1.QuobyteVolumeSource object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	否	io.k8s.api.core.v1.RBDVolumeSource object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: https://examples.k8s.io/volumes/rbd/README.md
scaleIO	否	io.k8s.api.core.v1.ScaleIOVolumeSource object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	否	io.k8s.api.core.v1.SecretVolumeSource object	Secret represents a secret that should populate this volume. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret
storageos	否	io.k8s.api.core.v1.StorageOSVolumeSource object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	否	io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

表 5-4422 io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

参数	是否必选	参数类型	描述
partition	否	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	否	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore
volumeID	是	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore

表 5-4423 io.k8s.api.core.v1.AzureDiskVolumeSource

参数	是否必选	参数类型	描述
cachingMode	否	String	Host Caching mode: None, Read Only, Read Write.
diskName	是	String	The Name of the data disk in the blob storage
diskURI	是	String	The URI the data disk in the blob storage
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

参数	是否必选	参数类型	描述
kind	否	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

表 5-4424 io.k8s.api.core.v1.AzureFileVolumeSource

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	是	String	the name of secret that contains Azure Storage Account Name and Key
shareName	是	String	Share Name

表 5-4425 io.k8s.api.core.v1.CephFSVolumeSource

参数	是否必选	参数类型	描述
monitors	是	Array of strings	Required: Monitors is a collection of Ceph monitors More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
path	否	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretFile	否	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
secretRef	否	io.k8s.api.core.v1.LocalObjectReference	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it
user	否	String	Optional: User is the rados user name, default is admin More info: https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it

表 5-4426 io.k8s.api.core.v1.CinderVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://examples.k8s.io/mysql-cinder-pd/README.md
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

参数	是否必选	参数类型	描述
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	是	String	volume id used to identify the volume in cinder. More info: https://examples.k8s.io/mysql-cinder-pd/README.md

表 5-4427 io.k8s.api.core.v1.ConfigMapVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

参数	是否必选	参数类型	描述
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-4428 io.k8s.api.core.v1.CSIVolumeSource

参数	是否必选	参数类型	描述
driver	是	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	否	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	否	io.k8s.api.core.v1.LocalObjectReference object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	否	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	是否必选	参数类型	描述
volumeAttributes	否	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

表 5-4429 io.k8s.api.core.v1.DownwardAPIVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	否	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of downward API volume file

表 5-4430 io.k8s.api.core.v1.EmptyDirVolumeSource

参数	是否必选	参数类型	描述
medium	否	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: https://kubernetes.io/docs/concepts/storage/volumes#emptydir
sizeLimit	否	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: http://kubernetes.io/docs/user-guide/volumes#emptydir

表 5-4431 io.k8s.api.core.v1.EphemeralVolumeSource

参数	是否必选	参数类型	描述
readOnly	否	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

参数	是否必选	参数类型	描述
volumeClaimTemplate	否	io.k8s.api.core.v1.PersistentVolumeClaimTemplate object	<p>Will be used to create a standalone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <code><pod name>-<volume name></code> where <code><volume name></code> is the name from the <code>PodSpec.Volumes</code> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

表 5-4432 io.k8s.api.core.v1.PersistentVolumeClaimTemplate

参数	是否必选	参数类型	描述
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	是	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

表 5-4433 io.k8s.api.core.v1.FCVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	否	Integer	Optional: FC target lun number
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	否	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	否	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

表 5-4434 io.k8s.api.core.v1.FlexVolumeSource

参数	是否必选	参数类型	描述
driver	是	String	Driver is the name of the driver to use for this volume.
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	否	Map<String,String>	Optional: Extra command options if any.
readOnly	否	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

表 5-4435 io.k8s.api.core.v1.FlockerVolumeSource

参数	是否必选	参数类型	描述
datasetName	否	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	否	String	UUID of the dataset. This is unique identifier of a Flocker dataset

表 5-4436 io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
partition	否	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
pdName	是	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk

表 5-4437 io.k8s.api.core.v1.GitRepoVolumeSource

参数	是否必选	参数类型	描述
directory	否	String	Target directory name. Must not contain or start with '!'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	是	String	Repository URL
revision	否	String	Commit hash for the specified revision.

表 5-4438 io.k8s.api.core.v1.GlusterfsVolumeSource

参数	是否必选	参数类型	描述
endpoints	是	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
path	是	String	Path is the Glusterfs volume path. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod
readOnly	否	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod

表 5-4439 io.k8s.api.core.v1.HostPathVolumeSource

参数	是否必选	参数类型	描述
path	是	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath
type	否	String	Type for HostPath Volume Defaults to "" More info: https://kubernetes.io/docs/concepts/storage/volumes#hostpath

表 5-4440 io.k8s.api.core.v1.ISCSIVolumeSource

参数	是否必选	参数类型	描述
chapAuthDiscovery	否	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	否	Boolean	whether support iSCSI Session CHAP authentication
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#iscsi
initiatorName	否	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	是	String	Target iSCSI Qualified Name.
iscsiInterface	否	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	是	Integer	iSCSI Target Lun number.

参数	是否必选	参数类型	描述
portals	否	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	是	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

表 5-4441 io.k8s.api.core.v1.LocalDirVolumeSource

参数	是否必选	参数类型	描述
sizeLimit	否	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0 1 ... 9 ::= ::= . . . ::= "+" "-" ::= ::= ::= Ki Mi Gi Ti Pi Ei (International System of units; See: http://physics.nist.gov/cuu/Units/binary.html) ::= m "" k M G T P E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e" "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2⁶³-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or</p>

参数	是否必选	参数类型	描述
			<p>suffix) is as large as possible. The sign will be omitted unless the number is negative. Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

表 5-4442 io.k8s.api.core.v1.NFSVolumeSource

参数	是否必选	参数类型	描述
path	是	String	Path that is exported by the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
readOnly	否	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs
server	是	String	Server is the hostname or IP address of the NFS server. More info: https://kubernetes.io/docs/concepts/storage/volumes#nfs

表 5-4443 io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

参数	是否必选	参数类型	描述
claimName	是	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
readOnly	否	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

表 5-4444 io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	是	String	ID that identifies Photon Controller persistent disk

表 5-4445 io.k8s.api.core.v1.PortworxVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	FSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	是	String	VolumeID uniquely identifies a Portworx volume

表 5-4446 io.k8s.api.core.v1.ProjectedVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	是	Array of io.k8s.api.core.v1.VolumeProjection objects	list of volume projections

表 5-4447 io.k8s.api.core.v1.VolumeProjection

参数	是否必选	参数类型	描述
configMap	否	io.k8s.api.core.v1.ConfigMapProjection object	information about the configMap data to project
downwardAPI	否	io.k8s.api.core.v1.DownwardAPIProjection object	information about the downwardAPI data to project
secret	否	io.k8s.api.core.v1.SecretProjection object	information about the secret data to project
serviceAccountToken	否	io.k8s.api.core.v1.ServiceAccountTokenProjection object	information about the serviceAccountToken data to project

表 5-4448 io.k8s.api.core.v1.ConfigMapProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the ConfigMap or its keys must be defined

表 5-4449 io.k8s.api.core.v1.DownwardAPIProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.DownwardAPIVolumeFile objects	Items is a list of DownwardAPIVolume file

表 5-4450 io.k8s.api.core.v1.DownwardAPIVolumeFile

参数	是否必选	参数类型	描述
fieldRef	否	io.k8s.api.core.v1.ObjectFieldSelector object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.

参数	是否必选	参数类型	描述
mode	否	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	是	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	否	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

表 5-4451 io.k8s.api.core.v1.ObjectFieldSelector

参数	是否必选	参数类型	描述
apiVersion	否	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	是	String	Path of the field to select in the specified API version.

表 5-4452 io.k8s.api.core.v1.ResourceFieldSelector

参数	是否必选	参数类型	描述
containerName	否	String	Container name: required for volumes, optional for env vars

参数	是否必选	参数类型	描述
divisor	否	String	Specifies the output format of the exposed resources, defaults to "1"
resource	是	String	Required: resource to select

表 5-4453 io.k8s.api.core.v1.SecretProjection

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	否	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	否	Boolean	Specify whether the Secret or its key must be defined

表 5-4454 io.k8s.api.core.v1.ServiceAccountTokenProjection

参数	是否必选	参数类型	描述
audience	否	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	否	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	是	String	Path is the path relative to the mount point of the file to project the token into.

表 5-4455 io.k8s.api.core.v1.QuobyteVolumeSource

参数	是否必选	参数类型	描述
group	否	String	Group to map volume access to Default is no group
readOnly	否	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	是	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes

参数	是否必选	参数类型	描述
tenant	否	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	否	String	User to map volume access to Defaults to serviceaccount user
volume	是	String	Volume is a string that references an already created Quobyte volume by name.

表 5-4456 io.k8s.api.core.v1.RBDVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: https://kubernetes.io/docs/concepts/storage/volumes#rbd
image	是	String	The rados image name. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
keyring	否	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
monitors	是	Array of strings	A collection of Ceph monitors. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
pool	否	String	The rados pool name. Default is rbd. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

参数	是否必选	参数类型	描述
readOnly	否	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it
user	否	String	The rados user name. Default is admin. More info: https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it

表 5-4457 io.k8s.api.core.v1.ScaleIOVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	是	String	The host address of the ScaleIO API Gateway.
protectionDomain	否	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	是	io.k8s.api.core.v1.LocalObjectReference object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	否	Boolean	Flag to enable/disable SSL communication with Gateway, default false

参数	是否必选	参数类型	描述
storageMode	否	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	否	String	The ScaleIO Storage Pool associated with the protection domain.
system	是	String	The name of the storage system as configured in ScaleIO.
volumeName	否	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

表 5-4458 io.k8s.api.core.v1.SecretVolumeSource

参数	是否必选	参数类型	描述
defaultMode	否	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

参数	是否必选	参数类型	描述
items	否	Array of io.k8s.api.core.v1.KeyToPath objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	否	Boolean	Specify whether the Secret or its keys must be defined
secretName	否	String	Name of the secret in the pod's namespace to use. More info: https://kubernetes.io/docs/concepts/storage/volumes#secret

表 5-4459 io.k8s.api.core.v1.KeyToPath

参数	是否必选	参数类型	描述
key	是	String	The key to project.
mode	否	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

参数	是否必选	参数类型	描述
path	是	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

表 5-4460 io.k8s.api.core.v1.StorageOSVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	否	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	否	io.k8s.api.core.v1.LocalObjectReference object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	否	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.

参数	是否必选	参数类型	描述
volumeNamespace	否	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

表 5-4461 io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

参数	是否必选	参数类型	描述
fsType	否	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	否	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	否	String	Storage Policy Based Management (SPBM) profile name.
volumePath	是	String	Path that identifies vSphere volume vmk

表 5-4462 io.k8s.api.apps.v1.StatefulSetUpdateStrategy

参数	是否必选	参数类型	描述
rollingUpdate	否	io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	否	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

表 5-4463 io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

参数	是否必选	参数类型	描述
partition	否	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

表 5-4464 io.k8s.api.core.v1.PersistentVolumeClaim

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	否	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

参数	是否必选	参数类型	描述
metadata	否	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	否	io.k8s.api.core.v1.PersistentVolumeClaimSpec object	Spec defines the desired characteristics of a volume requested by a pod author. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims
status	否	io.k8s.api.core.v1.PersistentVolumeClaimStatus object	Status represents the current information/status of a persistent volume claim. Read-only. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims

表 5-4465 io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

参数	是否必选	参数类型	描述
annotations	否	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: http://kubernetes.io/docs/user-guide/annotations
clusterName	否	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

参数	是否必选	参数类型	描述
creationTimestamp	否	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC. Populated by the system. Read-only. Null for lists. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
deletionGracePeriodSeconds	否	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

参数	是否必选	参数类型	描述
deletionTimestamp	否	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</p>

参数	是否必选	参数类型	描述
finalizers	否	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

参数	是否必选	参数类型	描述
generateName	否	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</p>
generation	否	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>
labels	否	Map<String,String>	<p>Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: http://kubernetes.io/docs/user-guide/labels</p>

参数	是否必选	参数类型	描述
managedFields	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	否	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/identifiers#names
namespace	否	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty. Must be a DNS_LABEL. Cannot be updated. More info: http://kubernetes.io/docs/user-guide/namespaces

参数	是否必选	参数类型	描述
ownerReferences	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	否	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</p>
selfLink	否	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>

参数	是否必选	参数类型	描述
uid	否	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations. Populated by the system. Read-only. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4466 io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

参数	是否必选	参数类型	描述
apiVersion	否	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	否	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	否	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	否	String	Manager is an identifier of the workflow managing these fields.
operation	否	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	否	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

表 5-4467 io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

参数	是否必选	参数类型	描述
apiVersion	是	String	API version of the referent.
blockOwnerDeletion	否	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	否	Boolean	If true, this reference points to the managing controller.
kind	是	String	Kind of the referent. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
name	是	String	Name of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#names
uid	是	String	UID of the referent. More info: http://kubernetes.io/docs/user-guide/identifiers#uids

表 5-4468 io.k8s.api.core.v1.PersistentVolumeClaimSpec

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the desired access modes the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1

参数	是否必选	参数类型	描述
dataSource	否	io.k8s.api.core.v1.TypedLocalObjectReference object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	否	io.k8s.api.core.v1.ResourceRequirements object	Resources represents the minimum resources the volume should have. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources
selector	否	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over volumes to consider for binding.
storageClassName	否	String	Name of the StorageClass required by the claim. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1

参数	是否必选	参数类型	描述
volumeMode	否	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	否	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

表 5-4469 io.k8s.api.core.v1.TypedLocalObjectReference

参数	是否必选	参数类型	描述
apiGroup	否	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	是	String	Kind is the type of resource being referenced
name	是	String	Name is the name of resource being referenced

表 5-4470 io.k8s.api.core.v1.ResourceRequirements

参数	是否必选	参数类型	描述
limits	否	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	是否必选	参数类型	描述
requests	否	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

表 5-4471 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

参数	是否必选	参数类型	描述
matchExpressions	否	Array of io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	否	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

表 5-4472 io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

参数	是否必选	参数类型	描述
key	是	String	key is the label key that the selector applies to.
operator	是	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

参数	是否必选	参数类型	描述
values	否	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

表 5-4473 io.k8s.api.core.v1.PersistentVolumeClaimStatus

参数	是否必选	参数类型	描述
accessModes	否	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1
capacity	否	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	否	Array of io.k8s.api.core.v1.PersistentVolumeClaimCondition objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	否	String	Phase represents the current phase of PersistentVolumeClaim.

表 5-4474 io.k8s.api.core.v1.PersistentVolumeClaimCondition

参数	是否必选	参数类型	描述
lastProbeTime	否	String	Last time we probed the condition.
lastTransitionTime	否	String	Last time the condition transitioned from one status to another.

参数	是否必选	参数类型	描述
message	否	String	Human-readable message indicating details about last transition.
reason	否	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	是	String	status is the status of the condition.
type	是	String	type is the type of the condition.

表 5-4475 io.k8s.api.apps.v1.StatefulSetStatus

参数	是否必选	参数类型	描述
collisionCount	否	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	否	Array of io.k8s.api.apps.v1.StatefulSetCondition objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	否	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	否	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).

参数	是否必选	参数类型	描述
observedGeneration	否	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	否	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	是	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	否	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)
updatedReplicas	否	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

表 5-4476 io.k8s.api.apps.v1.StatefulSetCondition

参数	是否必选	参数类型	描述
lastTransitionTime	否	String	Last time the condition transitioned from one status to another.
message	否	String	A human readable message indicating details about the transition.
reason	否	String	The reason for the condition's last transition.
status	是	String	Status of the condition, one of True, False, Unknown.
type	是	String	Type of statefulset condition.

响应参数

状态码： 200

表 5-4477 响应 Body 参数

参数	参数类型	描述
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	io.k8s.api.apps.v1.StatefulSetSpec object	Spec defines the desired identities of pods in this set.
status	io.k8s.api.apps.v1.StatefulSetStatus object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

表 5-4478 io.k8s.api.apps.v1.StatefulSetSpec

参数	参数类型	描述
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	io.k8s.api.core.v1.PodTemplateSpec object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.

参数	参数类型	描述
updateStrategy	io.k8s.api.apps.v1.StatefulSetUpdateStrategy object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of io.k8s.api.core.v1.PersistentVolumeClaim objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

表 5-4479 io.k8s.api.core.v1.PodTemplateSpec

参数	参数类型	描述
metadata	io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta object	Standard object's metadata. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata
spec	io.k8s.api.core.v1.PodSpec object	Specification of the desired behavior of the pod. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status

表 5-4480 io.k8s.api.core.v1.PodSpec

参数	参数类型	描述
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	io.k8s.api.core.v1.Affinity object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.

参数	参数类型	描述
containers	Array of io.k8s.api.core.v1.Container objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	io.k8s.api.core.v1.PodDNSConfig object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of io.k8s.api.core.v1.EphemeralContainer objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of io.k8s.api.core.v1.HostAlias objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.

参数	参数类型	描述
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of io.k8s.api.core.v1.LocalObjectReference objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod
initContainers	Array of io.k8s.api.core.v1.Container objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/init-containers/
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: https://kubernetes.io/docs/concepts/configuration/assign-pod-node/

参数	参数类型	描述
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of io.k8s.api.core.v1.PodReadinessGate objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md

参数	参数类型	描述
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	io.k8s.api.core.v1.PodSecurityContext object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

参数	参数类型	描述
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of io.k8s.api.core.v1.Toleration objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of io.k8s.api.core.v1.TopologySpreadConstraint objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of io.k8s.api.core.v1.Volume objects	List of volumes that can be mounted by containers belonging to the pod. More info: https://kubernetes.io/docs/concepts/storage/volumes

表 5-4481 io.k8s.api.core.v1.Affinity

参数	参数类型	描述
nodeAffinity	io.k8s.api.core.v1.NodeAffinity object	Describes node affinity scheduling rules for the pod.

参数	参数类型	描述
podAffinity	io.k8s.api.core.v1.PodAffinity object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	io.k8s.api.core.v1.PodAntiAffinity object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

表 5-4482 io.k8s.api.core.v1.NodeAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PreferredSchedulingTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	io.k8s.api.core.v1.NodeSelector object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

表 5-4483 io.k8s.api.core.v1.PreferredSchedulingTerm

参数	参数类型	描述
preference	io.k8s.api.core.v1.NodeSelectorTerm object	A node selector term, associated with the corresponding weight.

参数	参数类型	描述
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

表 5-4484 io.k8s.api.core.v1.NodeSelectorTerm

参数	参数类型	描述
matchExpressions	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's labels.
matchFields	Array of io.k8s.api.core.v1.NodeSelectorRequirement objects	A list of node selector requirements by node's fields.

表 5-4485 io.k8s.api.core.v1.NodeSelector

参数	参数类型	描述
nodeSelectorTerms	Array of io.k8s.api.core.v1.NodeSelectorTerm objects	Required. A list of node selector terms. The terms are ORed.

表 5-4486 io.k8s.api.core.v1.NodeSelectorRequirement

参数	参数类型	描述
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.

参数	参数类型	描述
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

表 5-4487 io.k8s.api.core.v1.PodAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-4488 io.k8s.api.core.v1.PodAntiAffinity

参数	参数类型	描述
preferredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.WeightedPodAffinityTerm objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of io.k8s.api.core.v1.PodAffinityTerm objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

表 5-4489 io.k8s.api.core.v1.WeightedPodAffinityTerm

参数	参数类型	描述
podAffinityTerm	io.k8s.api.core.v1.PodAffinityTerm object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

表 5-4490 io.k8s.api.core.v1.PodAffinityTerm

参数	参数类型	描述
labelSelector	io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

表 5-4491 io.k8s.api.core.v1.PodDNSConfig

参数	参数类型	描述
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of io.k8s.api.core.v1.PodDNSConfigOption objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

表 5-4492 io.k8s.api.core.v1.PodDNSConfigOption

参数	参数类型	描述
name	String	Required.
value	String	value is the value of the option

表 5-4493 io.k8s.api.core.v1.EphemeralContainer

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images

参数	参数类型	描述
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	Ports are not allowed for ephemeral containers.
readinessProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
resources	io.k8s.api.core.v1.ResourceRequirements object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	io.k8s.api.core.v1.SecurityContext object	SecurityContext is not allowed for ephemeral containers.
startupProbe	io.k8s.api.core.v1.Probe object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

参数	参数类型	描述
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

参数	参数类型	描述
volumeDevices	Array of io.k8s.api.core.v1.Volume Device objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.Volume Mount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-4494 io.k8s.api.core.v1.HostAlias

参数	参数类型	描述
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

表 5-4495 io.k8s.api.core.v1.LocalObjectReference

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

表 5-4496 io.k8s.api.core.v1.Container

参数	参数类型	描述
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell
env	Array of io.k8s.api.core.v1.EnvVar objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of io.k8s.api.core.v1.EnvFromSource objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

参数	参数类型	描述
image	String	Docker image name. More info: https://kubernetes.io/docs/concepts/containers/images This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: https://kubernetes.io/docs/concepts/containers/images#updating-images
lifecycle	io.k8s.api.core.v1.Lifecycle object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of io.k8s.api.core.v1.ContainerPort objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	io.k8s.api.core.v1.Probe object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
resources	io.k8s.api.core.v1.ResourceRequirements object	Compute Resources required by this container. Cannot be updated. More info: https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/

参数	参数类型	描述
securityContext	io.k8s.api.core.v1.SecurityContext object	Security options the pod should run with. More info: https://kubernetes.io/docs/concepts/policy/security-context/ More info: https://kubernetes.io/docs/tasks/configure-pod-container/security-context/
startupProbe	io.k8s.api.core.v1.Probe object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

参数	参数类型	描述
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of io.k8s.api.core.v1.VolumeDevice objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of io.k8s.api.core.v1.VolumeMount objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

表 5-4497 io.k8s.api.core.v1.EnvVar

参数	参数类型	描述
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

参数	参数类型	描述
valueFrom	io.k8s.api.core.v1.EnvVarSource object	Source for the environment variable's value. Cannot be used if value is not empty.

表 5-4498 io.k8s.api.core.v1.EnvVarSource

参数	参数类型	描述
configMapKeyRef	io.k8s.api.core.v1.ConfigMapKeySelector object	Selects a key of a ConfigMap.
fieldRef	io.k8s.api.core.v1.ObjectFieldSelector object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['<KEY>']</code> , <code>metadata.annotations['<KEY>']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	io.k8s.api.core.v1.ResourceFieldSelector object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	io.k8s.api.core.v1.SecretKeySelector object	Selects a key of a secret in the pod's namespace

表 5-4499 io.k8s.api.core.v1.ConfigMapKeySelector

参数	参数类型	描述
key	String	The key to select.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap or its key must be defined

表 5-4500 io.k8s.api.core.v1.SecretKeySelector

参数	参数类型	描述
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the Secret or its key must be defined

表 5-4501 io.k8s.api.core.v1.EnvFromSource

参数	参数类型	描述
configMapRef	io.k8s.api.core.v1.ConfigMapEnvSource object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	io.k8s.api.core.v1.SecretEnvSource object	The Secret to select from

表 5-4502 io.k8s.api.core.v1.ConfigMapEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names
optional	Boolean	Specify whether the ConfigMap must be defined

表 5-4503 io.k8s.api.core.v1.SecretEnvSource

参数	参数类型	描述
name	String	Name of the referent. More info: https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names

参数	参数类型	描述
optional	Boolean	Specify whether the Secret must be defined

表 5-4504 io.k8s.api.core.v1.Lifecycle

参数	参数类型	描述
postStart	io.k8s.api.core.v1.Handler object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks
preStop	io.k8s.api.core.v1.Handler object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks

表 5-4505 io.k8s.api.core.v1.Handler

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

表 5-4506 io.k8s.api.core.v1.ContainerPort

参数	参数类型	描述
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

表 5-4507 io.k8s.api.core.v1.SecurityContext

参数	参数类型	描述
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	io.k8s.api.core.v1.Capabilities object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

参数	参数类型	描述
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	io.k8s.api.core.v1.SELinuxOptions object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	io.k8s.api.core.v1.SeccompProfile object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

参数	参数类型	描述
windowsOptions	io.k8s.api.core.v1.WindowsSecurityContextOptions object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

表 5-4508 io.k8s.api.core.v1.Capabilities

参数	参数类型	描述
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

表 5-4509 io.k8s.api.core.v1.Probe

参数	参数类型	描述
exec	io.k8s.api.core.v1.ExecAction object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	io.k8s.api.core.v1.HTTPGetAction object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

参数	参数类型	描述
tcpSocket	io.k8s.api.core.v1.TCPSocketAction object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes

表 5-4510 io.k8s.api.core.v1.ExecAction

参数	参数类型	描述
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

表 5-4511 io.k8s.api.core.v1.HTTPGetAction

参数	参数类型	描述
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of io.k8s.api.core.v1.HTTPHeader objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

表 5-4512 io.k8s.api.core.v1.HTTPHeader

参数	参数类型	描述
name	String	The header field name
value	String	The header field value

表 5-4513 io.k8s.api.core.v1.TCPSocketAction

参数	参数类型	描述
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

表 5-4514 io.k8s.api.core.v1.VolumeDevice

参数	参数类型	描述
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

表 5-4515 io.k8s.api.core.v1.VolumeMount

参数	参数类型	描述
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '/'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

参数	参数类型	描述
policy	io.k8s.api.core.v1.Policy object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
